MODEL RESULTS

REMARKS : In search of the angle corresponding to
the maximum concentration, only the first
angle, of the angles with same maximum
concentrations, is indicated as maximum.

WIND ANGLE RANGE: 0.-360.

THE HIGHEST CONCENTRATION OF 2. ug/m**3 OCCURRED AT RECEPTOR REC13.

Hot Spot: Microscale (Local) Analysis

- Microscale Results
  - Carbon Monoxide (CO)
  - Particulate Matter 10 (PM_{10})
  - Particulate Matter 2.5 ($PM_{2.5}$)

This Page Intentionally Left Blank

Hot Spot: Microscale (Local) Analysis

Microscale Results

- Carbon Monoxide (CO)

Emission Factors for Locomotives

This Page Intentionally Left Blank

Technical Highlights

Emission Factors for Locomotives

The Environmental Protection Agency (EPA) has established emission standards for oxides of nitrogen (NOx), hydrocarbons (HC), carbon monoxide (CO), particulate matter (PM) and smoke for newly manufactured and remanufactured locomotives. These standards, which are codified at 40 CFR part 1033, include several sets of emission standards with applicability dependent on the date a locomotive is first manufactured. The first set of standards (Tier 0) applies to most locomotives originally manufactured before 2001. The most stringent set of standards (Tier 4) applies to locomotives originally manufactured in 2015 and later. This fact sheet describes EPA's estimates of the typical in-use emission rates for locomotives subject to these standards, as well as the previous standards.

It is important to emphasize that this fact sheet relies on many simplifying assumptions. Thus emission rates calculated as described in this fact sheet should be considered as approximations.

Estimated Locomotive Emission Rates by Tier

EPA has estimated average emission rates, given in grams per brake horsepower-hour (g/bhp-hr), for uncontrolled locomotives and those required to meet the various emission standards. Emissions were estimated for two different types of operation: a low power cycle representing operation in a switch yard, and a higher power cycle representative of general line-haul operation. These estimates are shown in Tables 1 and 2. Note that plus signs in the table indicate that a given tier of standards was revised in a 2008 rulemaking (73 FR 37096, June 30, 2008). For example, locomotives originally manufactured in years 2002-2004 were initially subject to the original Tier 1 standards, but will be required to meet revised Tier 1 standards (also known as Tier 1+ standards) when remanufactured. See the regulatory text for a more precise explanation of which standards apply to which locomotives.

EPA United States Environmental Protection Agency

Office of Transportation and Air Quality
EPA-420-F-09-025
April 2009

It is important to note that there can be significant variability in in-use emission rates, especially for uncontrolled locomotives. Also, a single locomotive's emission rate can vary throughout its life as the engine ages and as ambient conditions change. Thus the values presented here are intended to reflect the average emission rates. It is also worth noting that these emission estimates were developed in the context of adopting new emission standards. This is especially important for the CO emission factors. Because EPA's CO emission standards were intended to cap CO emissions at pre-control levels (which were relatively low), we have not projected any reductions in CO emission factors. However, recent testing indicates that emission controls designed to reduce PM and HC emissions are also reducing CO emissions. Thus the CO emission rates presented here may be too high and should be used with some caution. A similar effect may also apply for HC emissions from Tier 0 and Tier 1 locomotives (but not the Tier 0+ and Tier 1+ locomotives).

Table 1 - Line-Haul Emission Factors (g/bhp-hr)

Conversion to Gram per Gallon Emission Factors

It is often useful to express emission rates as grams of pollutant emitted per gallon of fuel consumed (g/gal). This can be done by multiplying the emission rates in Table 1 or 2 by a conversion factor relating the fuel consumption (gal/hr) and the usable power (bhp) of the engine. EPA has estimated different conversion factors for different types of locomotive service as shown in Table 3. The two primary reasons for the differences are variations in locomotive age and duty cycle. Fuel efficiency tends to be worse for older locomotive designs and for locomotives used in low power applications such as switching. Note that the g/gal emission factors presented at the end of this fact sheet can be converted back to g/bhp-hr by dividing them by the conversion factors shown here.

Table 3
Conversion Factors (bhp-hr/gal)

Locomotive Application	Conversion Factor (bhp-hr/gal)
Large Line-Haul and Passenger	20.8
Small Line-Haul	18.2
Switching	15.2

Conversion to Gram per Ton-Mile Emission Factors

In some cases, it can be helpful to express emission factors as grams emitted per ton-mile of freight hauled. However, this can also be very problematic because the amount of engine work required for each ton-mile varies significantly with a variety of factors. For example, it takes more work to haul freight through mountainous terrain than across flat areas. Since EPA does not have detailed information about these variations, we cannot provide accurate g/ton-mile emission rates. However, very approximate national average values can be calculated based on data collected by the Association of American Railroads for revenue ton-miles and fuel consumption, which show that about one gallon of fuel is consumed by the railroads to haul 400 tons-miles of freight. Thus dividing g/gal emission rates by 400 ton-miles/gal gives approximate g/ton-mile emission rates.

Emission Inventory Estimation

Total emissions can be calculated by multiplying the emission factors (in g/gal) by the fuel consumption rates (in million-gal/yr) to give annual emission rates (in metric tons per year). Multiplying this metric estimate by 1.102 gives standard U.S. tons (or short tons) per year.

EPA has estimated that locomotives consume approximately 4 billion gallons of diesel fuel each year. This includes national/regional freight service, switching, local freight service, and passenger service. The relative amounts of fuel used in the United States for these four different types of operation are shown in Table 4. The great majority of fuel consumed by locomotives each year is used in line-haul freight service by the largest railroads. Smaller amounts are also used in

switching and passenger service, and by very small railroads. For the purpose of this fact sheet, we are aggregating the largest railroads with smaller railroads that are fully subject to EPA's emission requirements. This includes regional railroads as well as other railroads such as those that are owned by large businesses. The local freight category includes only those railroads that meet our regulatory definition of "small railroad" (40 CFR 1033.901) to qualify for small business allowances under our regulations. These railroads are included in this fact sheet as local whether or not they are truly local in nature. The passenger category includes local commuter railroads and AMTRAK.

Table 4 - Locomotive Fuel Consumption by Service Category	
National and Regional Freight Line-haul	88%
National Freight Switching	7%
Local Freight	<2%
Passenger	3%

Other Pollutants

The preceding emission factors include those pollutants for which EPA has set emission standards. However, other pollutants may also be of interest.

The broad category of volatile organic compounds (VOC) is a slightly different way of aggregating the organic pollutants controlled by our HC emission standards. In our rulemaking analysis (http://www.epa.gov/otaq/regs/nonroad/420r08001a.pdf), we estimated that VOC emissions can be assumed to be equal to 1.053 times the HC emissions. Similarly, PM emissions can be expressed as PM_{10} (which includes all particles up to 10 microns in diameter) or $PM_{2.5}$ (which includes only those particles up to 2.5 microns in diameter). $PM_{2.5}$ emissions can be estimated as 0.97 times the PM_{10} emissions, meaning that nearly all of the PM is less than 2.5 microns in diameter.

Gram per gallon emissions of sulfur dioxide (SO_2) and carbon dioxide (CO_2) are largely independent of engine parameters and are primarily dependent on fuel properties. Locomotive-specific emission rates are not presented here. Instead, SO_2 and CO_2 emission rates should be calculated based on the properties of the specific fuel being used by the locomotives. These emission rates can also be assumed to be the same as for other diesel engines operating on similar fuel. Note that special caution should be used when estimating SO_2 emission rates since the sulfur content of diesel fuel varies much more than the carbon content. Also, while the vast majority of sulfur in the fuel is typically converted to SO_2, up to 5 percent of the sulfur is oxidized further to sulfate (and forms particulate matter), so that the fraction of fuel sulfur emitted as SO_2 may be as low as 95 percent. Examples of these calculations are shown below based on inputs described in the NONROAD technical document NR-009c (http://www.epa.gov/otaq/models/nonrdmdl/nonrdmdl2004/420p04009.pdf).

SO_2 (g/gal) = (fuel density) × (conversion factor) × (64 g SO_2/32 g S) × (S content of fuel)

Consider the example where the density of diesel fuel is 3200 g/gal, the fraction of fuel sulfur converted to SO_2 is 97.8 percent, and the sulfur content of the fuel is 300 ppm.

SO_2 (g/gal) = (3200) × (0.978) × (2.00) × (300×10^{-6}) = 1.88 g/gal

CO_2 (g/gal) = (fuel density) × (44 g CO_2/12 g C) × (C content of fuel)

Consider the example where the density of diesel fuel is 3200 g/gal and the carbon content of the fuel is 87 percent by mass.

CO_2 (g/gal) = (3200) × (3.67) × (0.87) = 10,217 g/gal

Other trace pollutants such as N_2O, methane, and many air toxics are more dependent on engine parameters. At this time, however, EPA does not have detailed emission rates for these pollutants from locomotives. Where estimates are needed for N_2O or methane, you may assume that emissions of these pollutants from locomotives are similar to those of other diesel engines with similar technology. For N_2O, you may assume the emissions are proportional to total NOx. For methane, you may assume the emissions are proportional to total hydrocarbons. Note however, that the presence of catalyzed components in the exhaust can significantly affect these ratios. So it is best to compare emissions from uncatalyzed locomotives to emissions from other uncatalyzed diesel engines. While this same approach could be used for air toxics (assuming that air toxic emissions are proportional to total hydrocarbons), EPA has estimated air toxic emissions from locomotives. These estimates are described in the National Emission Inventory documentation (see ftp://ftp.epa.gov/EmisInventory/2002finalnei/documentation/mobile/2002nei_mobile_nonroad_methods.pdf - appendix C).

Projected Future Emission Factors

Tables 5-7 give the expected fleet average NOx, PM_{10}, and HC emission factors by calendar year for the four categories of locomotives (the same four categories as are shown in Table 4). The steady decline in these emission factors reflects the penetration of the various tiers of locomotives into the fleet over time. More detail regarding the assumptions on which these projections were based can be found in the Regulatory Impact Analysis for the 2008 rulemaking (http://www.epa.gov/otaq/regs/nonroad/420r08001a.pdf)

RE: South Coast Rail Project

Dear Sir,

The Executive Office of Transportation and Public Works (EOT) is proposing a transportation project to provide public transportation between Boston and the cities of Fall River and New Bedford within the Commonwealth's South Coast region. The South Coast Rail project is undergoing a joint state (MEPA) and federal (NEPA) environmental review process. An Environmental Notification Form (ENF) was submitted for review under MEPA on November 17, 2008. As noted in the ENF, based upon Massachusetts Geographic Information Systems (MassGIS), segments of the South Coast Rail alternatives are in proximity to open space owned by the Town of Easton (see attached figures):

SITE NAME	OWNER	MANAGER
Fields associated with Center Elementary School	Town of Easton	Town of Easton School Department
Conservation Land	Town of Easton	Town of Easton Conservation Commission
Conservation Land	Town of Easton	Town of Easton Conservation Commission
Conservation Land	Town of Easton	Town of Easton Conservation Commission
Conservation Land	Town of Easton	Town of Easton Conservation Commission
Conservation Land	Town of Easton	Town of Easton Conservation Commission
Fields associated with Oliver Ames School & Easton Middle School	Town of Easton	Town of Easton School Department
Ricker Field	Town of Easton	Town of Easton Conservation Commission
Fields associated with Southeastern Reg Voc Tech HS	Town of Easton	Town of Easton Regional School District
Town Land	Town of Easton	Town of Easton Board of Selectmen
Town Land	Town of Easton	Town of Easton Board of Selectmen

Source: MassGIS
Note: Each site identified in this table may not be depicted on the attached figures.

We ask that you confirm that this list of public open space properties is accurate and complete, and confirm the use (passive recreation, active recreation, etc) for each property that is in proximity to the proposed alternatives. Proximity is defined as those parcels that abut, could potentially abut, or are within a ½-mile of a potential station location or existing or proposed rail right-of-way.

99 High Street, 10th Floor
Boston, Massachusetts 02110-2354
617.728.7777 ▪ FAX 617.728.7782
email: info@vhb.com
www.vhb.com

If there are protected public parks or recreation areas that are not on this list, we kindly request that you identify them and any of the following information, if known:

- Name and address of parcel
- Owner's name (if not owned by the Town)
- Size (in acres) of the property
- Brief description/uses of the property
- Map of the property (if available)

Your assistance with this request is greatly appreciated. If we do not hear from you before January 16, 2009, we will be following up via phone. In the meantime, if you have any questions, please call me at (617) 924-1770.

Very truly yours,

VANASSE HANGEN BRUSTLIN, INC.

Subject: Town-owned Land Abutting Rail ROW

Lisa,

Attached is the list of town-owned land abutting the Rail ROW. Since no parcel identification is provided, it is hard to tell what the parcels are in the list VHB sent. This list does not include property owned by the Southeastern Regional School District, as it is not town-owned and does not include fields associated with Oliver Ames High School and the Middle School, since these are no where near the ROW.

RE: South Coast Rail Project

Dear Sir,

The Executive Office of Transportation and Public Works (EOT) is proposing a transportation project to provide public transportation between Boston and the cities of Fall River and New Bedford within the Commonwealth's South Coast region. The South Coast Rail project is undergoing a joint state (MEPA) and federal (NEPA) environmental review process. An Environmental Notification Form (ENF) was submitted for review under MEPA on November 17, 2008. As noted in the ENF, based upon Massachusetts Geographic Information Systems (MassGIS), segments of the South Coast Rail alternatives are in proximity to open space owned by the City of Fall River (see attached figures):

SITE NAME	OWNER	MANAGER
Bicentennial Park	City of Fall River	City of Fall River Parks and Recreation Department
Griffin Playground	City of Fall River	City of Fall River Parks and Recreation Department
Heritage Park	City of Fall River	City of Fall River Parks and Recreation Department
Walkway	City of Fall River	City of Fall River Parks and Recreation Department
Kennedy Park (2 parcels)	City of Fall River	City of Fall River Parks and Recreation Department
North Park	City of Fall River	City of Fall River Parks and Recreation Department
Turner Playground	City of Fall River	(unavailable)
(Unnamed - see attached Figure 5.3a, Tile 2)	City of Fall River	(unavailable)

Source: MassGIS
Note: Each site identified in this table may not be depicted on the attached figures.

We ask that you confirm that this list of public open space properties is accurate and complete, and confirm the use (passive recreation, active recreation, etc) for each property that is in proximity to the proposed alternatives. Proximity is defined as those parcels that abut, could potentially abut, or are within a ½-mile of a potential station location or existing or proposed rail right-of-way.

If there are protected public parks or recreation areas that are not on this list, we kindly request that you identify them and provide the following information:

- Name and address of parcel
- Owner's name (if not owned by the Town)
- Size (in acres) of the property

RE: South Coast Rail Project

Dear Ms. Carvalho,

On behalf of the Executive Office of Transportation and Public Works (EOT), I would like to thank you for your prompt confirmation of Freetown properties currently protected and/or being used for active/passive recreation in proximity to the proposed South Coast Rail Project.

We are currently reviewing the provided information and supporting maps and will contact you with any questions. In the meantime, if you should have any questions, please call me at (617) 924-1770.

Your assistance with this request is greatly appreciated.

RE: South Coast Rail Project

Dear Sir,

The Executive Office of Transportation and Public Works (EOT) is proposing a transportation project to provide public transportation between Boston and the cities of Fall River and New Bedford within the Commonwealth's South Coast region. The South Coast Rail project is undergoing a joint state (MEPA) and federal (NEPA) environmental review process. An Environmental Notification Form (ENF) was submitted for review under MEPA on November 17, 2008. As noted in the ENF, based upon Massachusetts Geographic Information Systems (MassGIS), segments of the South Coast Rail alternatives are in proximity to open space owned by the Town of Lakeville (see attached figures):

SITE NAME	OWNER	MANAGER
Fields associated with Apponquet Regional High School (2 parcels)	M102/M146	Regional School District

Source: MassGIS
Note: Each site identified in this table may not be depicted on the attached figures.

We ask that you confirm that this list of public open space properties is accurate and complete, and confirm the use (passive recreation, active recreation, etc) for each property that is in proximity to the proposed alternatives. Proximity is defined as those parcels that abut, could potentially abut, or are within a ½-mile of a potential station location or existing or proposed rail right-of-way.

If there are protected public parks or recreation areas that are not on this list, we kindly request that you identify them and provide the following information:

- Name and address of parcel
- Owner's name (if not owned by the Town)
- Size (in acres) of the property
- Brief description/uses of the property
- Map of the property (if available)

RE: South Coast Rail Project

Dear Madam,

The Executive Office of Transportation and Public Works (EOT) is proposing a transportation project to provide public transportation between Boston and the cities of Fall River and New Bedford within the Commonwealth's South Coast region. The South Coast Rail project is undergoing a joint state (MEPA) and federal (NEPA) environmental review process. An Environmental Notification Form (ENF) was submitted for review under MEPA on November 17, 2008. As noted in the ENF, based upon Massachusetts Geographic Information Systems (MassGIS), segments of the South Coast Rail alternatives are in proximity to open space owned by the Town of Middleborough (see attached):

SITE NAME	OWNER	MANAGER
Fields associated with Henry Burkland Elementary School	Town of Middleborough	Town of Middleborough School Department
Fields associated with Mary K Goode Elementary School	Town of Middleborough	Town of Middleborough School Department
Oliver Mill Park	Town of Middleborough	Town of Middleborough Parks Department
Westside Playground	Town of Middleborough	Town of Middleborough Parks Department

Source: MassGIS
Note: Each site identified in this table may not be depicted on the attached figures.

We ask that you confirm that this list of public open space properties is accurate and complete, and confirm the use (passive recreation, active recreation, etc) for each property that is in proximity to the proposed alternatives. Proximity is defined as those parcels that abut, could potentially abut, or are within a ½-mile of a potential station location or existing or proposed rail right-of-way.

If there are protected public parks or recreation areas that are not on this list, we kindly request that you identify them and provide the following information:

- Name and address of parcel
- Owner's name (if not owned by the Town)
- Size (in acres) of the property
- Brief description/uses of the property

Subject: Middleborough open space properties--finally

Hi, Lisa;
Attached is a pdf of the open space within ½ mile of the proposed village station site, and the Everett Street site. Open space within ½ mile of the layover site is for all intents and purposes the same as the village station site. Ownership is color coded, text below indicates ownership other than Town, or separate town agency. Middleborough Gas & Electric is not the same as the Town.

Below are the properties by number:
Village station, Layover sites

1. Westside school, West End playground. 11 acres. As name implies, playground, tot lot, two ball fields.
2. Middleborough Gas & Electric
3. Public library ½ acre
4. Police station ½ acre
5. Flora Clarke School ½ acre, school admin office
6. Pearl Street property 1 acre, unknown use
7. Town Hall (3 acre) and Lincoln Lynch School (not in service, 1.5 acre)
8. School Street School (historic school) 1 acre
9. Thomas Sproat Pierce Park, 24 acres, pool, skateboard park, fields
10. Mayflower Burkland School, 38.61 acres, Field of Dreams, 7.1 acres, 5 baseball diamonds, 3 basketball courts, two playgrounds, opne vield, indoor pool, ADA accessible.

Everett Street station site

11. Oliver Mill Park on Nemasket River, 5.16 acres, historic and passive recreation use, picnic tables, trails and bridges, herring run/fish ladder, canoe launch
12. Conservation Commission-owned 16.5 acres adjacent to Oliver Mill, passive recreation and wildlife viewing.
13. Town-owned Animal Shelter and waste water treatment plant, 9.6 acres total
14. Conservation-owned canoe launch area at end of Settler's Crossing, about 2 acres
15. Middleborough Water Department-owned well site, 31.2 acres total
16. Town-owned, 16.0 acres, unknown use.

Sorry it took so long—the info is not all in one place, and we have some really bizarre software called Integraph.

Regards,
Joyce E. Rowley, AICP

Dear Sir or Madam,

The Executive Office of Transportation and Public Works (EOT) is proposing a transportation project to provide public transportation between Boston and the cities of Fall River and New Bedford within the Commonwealth's South Coast region. The South Coast Rail project is undergoing a joint state (MEPA) and federal (NEPA) environmental review process. An Environmental Notification Form (ENF) was submitted for review under MEPA on November 17, 2008. As noted in the ENF, based upon Massachusetts Geographic Information Systems (MassGIS), segments of the South Coast Rail alternatives are in proximity to open space owned by the Town of Stoughton (see attached figures):

SITE NAME	OWNER	MANAGER
Cedar Swamp	Town of Stoughton	Town of Stoughton Conservation Commission
Former Shiretown Parcel	Town of Stoughton	Town of Stoughton Conservation Commission
Halbran Field	Town of Stoughton	Town of Stoughton Recreation Department
Fields associated with Gibbons School	Town of Stoughton	Town of Stoughton Recreation Department
Fields associated with Jones School and High School	Town of Stoughton	Town of Stoughton Recreation Department
Lehan Field	Town of Stoughton	Town of Stoughton Recreation Department
Libby Farm	Town of Stoughton	Town of Stoughton Conservation Commission
Lipsky Field	Town of Stoughton	Town of Stoughton Recreation Department
Marks Field	Town of Stoughton	Town of Stoughton Recreation Department
Meads Meadow	Town of Stoughton	Town of Stoughton Recreation Department
North Stoughton Tot Lot	Town of Stoughton	Town of Stoughton Recreation Department
Fields associated with West Elementary School	Town of Stoughton	Town of Stoughton Recreation Department
Stoughton Memorial Conservation Land	Town of Stoughton	Town of Stoughton Conservation Commission
T.L. Edwards Estate	Town of Stoughton	Town of Stoughton Conservation Commission
Woods Pond	Town of Stoughton	Town of Stoughton Conservation Commission
Bird Street Conservation Area	Town of Stoughton	Town of Stoughton Conservation Commission
Elm Street Field	(unavailable)	(unavailable)
D. Forbes Estate	(unavailable)	(unavailable)

We ask that you confirm that this list of public open space properties is accurate and complete, and confirm the use (passive recreation, active recreation, etc) for each property that is in proximity to the proposed alternatives. Proximity is defined as those parcels that abut, could potentially abut, or are within a ½-mile of a potential station location or existing or proposed rail right-of-way.

If there are protected public parks or recreation areas that are not on this list, we kindly request that you identify them and provide the following information:

- Name and address of parcel
- Owner's name (if not owned by the Town)
- Size (in acres) of the property
- Brief description/uses of the property
- Map of the property (if available)

Your assistance with this request is greatly appreciated. If we do not hear from you before January 16, 2009, we will be following up via phone. In the meantime, if you have any questions, please call me at (617) 924-1770.

Very truly yours,

VANASSE HANGEN BRUSTLIN, INC.

RE: South Coast Rail Project

Dear Sir,

The Executive Office of Transportation and Public Works (EOT) is proposing a transportation project to provide public transportation between Boston and the cities of Fall River and New Bedford within the Commonwealth's South Coast region. The South Coast Rail project is undergoing a joint state (MEPA) and federal (NEPA) environmental review process. An Environmental Notification Form (ENF) was submitted for review under MEPA on November 17, 2008. As noted in the ENF, based upon Massachusetts Geographic Information Systems (MassGIS), segments of the South Coast Rail alternatives are in proximity to open space owned by the City of Taunton (see attached figures):

SITE NAME	OWNER	MANAGER
Fields associated with Bristol Plymouth Regional Technical School	City of Taunton	City of Taunton School Department
Bunk Pond	City of Taunton	City of Taunton Conservation Commission
Dever State School/Watson Pond	(unavailable)	(unavailable)
Memorial Park	City of Taunton	City of Taunton Parks and Recreation Department
Mill River Park	City of Taunton	City of Taunton Parks and Recreation Department
Plonka Property	City of Taunton	City of Taunton Conservation Commission
Fields associated with Taunton High School	City of Taunton	City of Taunton School Department
Terra Property	City of Taunton	City of Taunton Conservation Commission
Union Plaza	City of Taunton	City of Taunton Parks and Recreation Department
Weir Park	City of Taunton	City of Taunton Parks and Recreation Department
Woodward Springs	City of Taunton	City of Taunton Conservation Commission
(Unnamed)	City of Taunton	City of Taunton Parks and Recreation Department

Source: MassGIS
Note: Each site identified in this table may not be depicted on the attached figures.

We ask that you confirm that this list of public open space properties is accurate and complete, and confirm the use (passive recreation, active recreation, etc) for each property that is in proximity to the proposed alternatives. Proximity is defined as those parcels that abut, could potentially abut, or are within a ½-mile of a potential station location or existing or proposed rail right-of-way.

Re: Whittenton Branch Solid Waste Concern,
Taunton and Raynham, Massachusetts

On behalf of the Massachusetts Department of Transportation (MassDOT), VHB has conducted a limited review of the current use of a portion of the inactive Whittenton Branch railroad right-of-way (ROW) that lies between Prospect Hill Street, Regan Circle, and the property at 184 Broadway in Raynham, Massachusetts (the Site). This limited review was conducted to evaluate fill material reportedly present on the ROW, specifically for the presence of Oil and/or Hazardous Material (OHM) which could have the potential to impact the future development of the Site for the South Coast Rail Whittenton Alternative (the Project). New England Recycling, Inc. (NER), having a primary address at 565 Winthrop Street in Taunton, Massachusetts (Taunton Facility), stores their material at 138 (Rear) Broadway in Raynham, Massachusetts (Raynham Facility), partially within the Site boundary as an unauthorized use. It should be noted that NER is also affiliated with G. Lopes Construction Company of Taunton, Massachusetts. A Site location map showing the vicinity of the Site is provided as **Figure 1**. An aerial photograph depicting relevant Site features and adjacent areas is provided as **Figure 2**.

Description of Files Reviewed

On May 16, 2012, VHB visited the Massachusetts Department of Environmental Protection (MassDEP) Southeast Regional Office to review the permit file associated with the NER Raynham Facility that, as noted above, is partially within the railroad ROW. The following is a list of pertinent documents:

- June 9, 1992 Notice of Noncompliance (NON) from MassDEP for the Raynham Facility (NON-SE-92-4002). Violations noted included the presence of refuse and brush dumped on the property within 100 feet of a potential wetlands resource area and within an Interim Well Head Protection Area.

- May 17, 1993 MassDEP field notes describing the Raynham Facility. Inspectors noted pile of construction and demolition (C&D) debris with solid waste (tires, wood waste metal stripping, brick, concrete, insulation, paper bags, and plastic buckets); piles of telephone poles with creosote, and a roll-off containing metal, pipes, fences, and rebar.

- August 25, 1993 letter from Fasanella Johnson & Wood P.C. (FJ&W) attorneys to MassDEP stating that NER does not have a stockpile or any metals or wood demolition materials at the Raynham Facility.

- September 9, 1993 NON from MassDEP for the Raynham Facility (NON-SE-93-4028). Violations noted included:

- The processing of solid waste in absence of a site assignment from the regulating board of health or MassDEP due to the presence of solid waste commingled with asbestos, brick, and concrete (ABC) rubble. Also noted was the processing of C&D debris in absence of an approval from MassDEP.
- No site assignment was obtained for operations such as solid waste processing, nor has the Operator obtained a permit from MassDEP. The operator is in violation of 310 CMR 19.000.
- In addition, MassDEP noted that the previous NON dated June 1992 had not been addressed.

- September 21, 1993 letter from FJ&W stating that the operator no longer accepts non pre-sorted ABC rubble, no solid waste is currently stockpiled at the property, and the Taunton and Raynham Conservation Commissions were satisfied with the operator's actions taken toward achieving wetland compliance.

- October 19, 1993 letter of provisional compliance to NON-SE-93-4028 from MassDEP to NER regarding the Raynham Facility. The letter states that MassDEP considers NER to have complied with NON-SE-93-4028. Based on documents, it appears the NON-SE-92-4002 was also addressed through these actions, although an express letter from MassDEP providing notice of compliance was not obtained during the file review.

- November 1, 1993 sketch prepared by G. Lopes Construction, Inc. showing items stored on-site including loam, mulch, stump chips, split stumps, roots and stone.

- December 8, 1993 letter from MassDEP to NER addressing several issues surrounding the facility operations. The letter reiterates that issues of noncompliance for the processing of ABC commingled with solid waste assigned NON-SE-93-4028 have been rectified; the ABC processing operation may be conditionally exempt; stump chipping at the facility requires an application or remedial plan; and an application must be made to MassDEP if the operator intends to compost material at the facility.

- November 16, 1993 letter from FJ&W providing documentation to confirm that the operations at the Raynham Facility are conditionally exempt in accordance with 310 CRM 16.05(3)(i).

- April 11, 1994 letter from MassDEP to Gilbert J. Lopes (NER) in response to proposal to conduct stump processing at the Raynham Facility. MassDEP stated that this activity would be conditionally exempt when conducted in accordance with 310 CRM 16.05(1).

- December 1994 permit (BWP SW 17) for recycling operation involving stumps, which is not conditionally exempt due to speculative accumulation (stumps may not be removed from Site within 90 days due to variations in deliveries).

- September 2006 Beneficial Use Determination (BUD) application for NER prepared by Green Seal Environmental, Inc. The permit specifies the proposed project as the reuse of post-consumer asphalt shingles and lists NER's Taunton Facility as that which requires approval. NER intended to process and mix the shingles materials with ABC and soil to create a sub-grade road base material to be used for road-base construction project throughout Massachusetts. All sorting of material would be conducted at the Taunton Facility, while the mixing of the road-base (shingles and gravel) would be conducted at the Raynham Facility. Laboratory analysis of the material was to be conducted on a load-by-load basis to evaluate for the presence of asbestos.

- Draft January 2007 BUD prepared by MassDEP for the re-use of pre and post consumer asphalt roofing shingles by NER. MassDEP describes the Raynham Facility operations as an existing sand and gravel, ABC rubble recycling, and wood waste composting operation. MassDEP approves the use of asphalt roofing shingles as a feedstock material at the Raynham Facility for the

manufacture/production of a sub-grade road base construction material. The approval specifies that one sample of each load must be tested for the presence of ACM.

- April 10, 2007 letter from MassDEP to Mr. Gilbert Lopes of NER providing draft provisional approval of the BUD for the reuse of asphalt roofing shingles.

- April 14, 2007 letter from the North Raynham Water District stating that the Raynham Facility is within a Zone II water supply area. A request was made to install monitoring wells and test for sodium and hydrocarbons because the asphalt being received by the facility could contain oil, gasoline, and road salts.

- September 5, 2007 article from the Enterprise Newspaper in Brockton, Massachusetts about the complaints the abutting residents have regarding the Raynham Facility. The article cited an agreement that the company made four years prior to construct a 1,000-foot-long, 8-foot-high berm planted with small evergreen trees along an old railroad bed to rectify the noise and dust problem.

During a visit to municipal offices on April 26, 2012, VHB also reviewed files pertaining to the Site at the selectman's office. A Notice of Administrative Completeness from MassDEP to NER dated November 15, 2006 was obtained. This letter pertained to the BUD for the reuse of asphalt roofing shingles.

VHB reviewed the MassDEP online waste site database for releases of OHM that may have occurred at the Site. One disposal site was identified on the G. Lopes Construction Raynham Yard located off Route 138. The disposal site was assigned Release Tracking Number (RTN) 4-22319 in December 2009 when approximately 50 gallons of hydraulic oil leaked from a ruptured line of an excavator to the underlying soil. An approximately 20 by 25 foot area was impacted, from which approximately 12 tons of impacted soil was removed and transported off-Site. The disposal site achieved a Class A-2 Response Action Outcome (RAO) in January 2010, which indicates that contaminant concentrations were not reduced to background levels but a Condition of No Significant Risk was achieved. Based on figures provided in the RAO report, the disposal site appears to be located approximately 250 feet south of the railroad ROW. Due to the nature of the release and the proximity to the Site, this disposal site is not expected to impact environmental media within the ROW.

File Review Summary

VHB conducted a review of available MassDEP permits and reports, as well as relevant municipal files. As indicated in the files, the Raynham Facility has received two enforcement notices from MassDEP (NON-SE-93-4028 and NON-SE-92-4002). NON-SE-93-4028 was issued in response to NER's failure to act after receiving NON-SE-92-4002. In October 1993, MassDEP stated that NER had complied with NON-SE-93-4028. Although a letter of compliance was not provided for NON-SE-92-4002, the areas of noncompliance appear to have been addressed in response to NON-SE-93-4028 and associated correspondences. The permit file also contained an approved BUD application. Finally, one MassDEP state-listed disposal site (RTN 4-22319) is located on the Raynham Facility property but is not likely to impact environmental media at the Site.

Site Reconnaissance

On July 23, 2012 VHB conducted a Site visit of the Raynham Facility and Site, which was guided by Norman Crowley of NER. A portable computer with GPS receiver was utilized by VHB personnel to determine the limits of the railroad ROW while in the field.

The western end of the ROW closest to Prospect Hill Pond was noted to abut a large pile of stumps and tree limbs that was encroaching upon the ROW. The pile was associated with the NER stump composting process whereby the stumps are initially stored until soft enough to be machine ground and then stored until composted for resale. In addition to the stumps, minor amounts of domestic waste and

boulders were observed in the pile. A second large pile containing sand, gravel, stumps, and minor debris was noted on another portion of the ROW located within NER's area of operation. According to Mr. Crowley, the piles on the Site are constantly changing as NER imports and exports the materials and no testing is performed for material processed at the Raynham Facility. Mr. Crowley stated that the Raynham Facility does not currently process asphalt shingles and they do not accept painted concrete. In addition, he stated that any material that contains undesirable items such as railroad ties is segregated and shipped to another facility. VHB did not note any significant stressed vegetation, staining, or odors at the time of the Site visit.

The remainder of the ROW in the vicinity of Regan Circle was observed to be densely vegetated. Landscaped trees and shrubs were noted in the ROW behind four properties on Regan Circle. Site photographs taken by VHB are attached to this memo.

Findings

Based on a review of MassDEP files pertaining to the Raynham Facility, the following materials appear to be permitted for storage at the NER Facility: post-consumer asphalt shingles (non-asbestos containing materials), pre-sorted ABC rubble, wood waste, sand and gravel. VHB observed these materials during the Site visit in July 2012, in addition to minor amounts of debris including buckets, plastic bags, wire, and rebar. Material was stored partially within the railroad ROW, a use not authorized by the railroad. The solid waste/debris noted does not appear to constitute a release of OHM to the environment as defined by the Massachusetts Contingency Plan (310 CMR 40.00). Although no staining was observed during the Site visit, several pieces of large machinery were observed throughout the Site and may have the potential to release minor amounts of OHM to the environment.

Conclusions

The ROW is currently occupied by what appears to be material containing stumps, compost, sand, gravel, boulders, and minor amounts of solid waste and debris. NER has indicated that this material is frequently relocated and new material brought into the Site and as such, could likely be relocated. Once the ROW has been restored and/or material has been permanently re-located, laboratory data could be obtained to assess for the presence of OHM.

Re: MassDEP File Review for Proposed Dana Street Station in Taunton, Massachusetts

---

On behalf of the Massachusetts Department of Transportation (MassDOT), VHB has conducted a review of the Massachusetts Department of Environmental Protection (MassDEP) Bureau of Waste Site Cleanup (BWSC) online database to identify state-listed disposal sites located in the vicinity of the proposed Dana Street Station in Taunton, Massachusetts (the Site). VHB also reviewed to historic Sanborn Fire Insurance maps available online through ProQuest in order to establish a general Site history. The Site as referenced in this memo encompasses various design options for the proposed station (the Project), which is part of the Whittenton Alternative of the South Coast Rail (SCR) project. The footprints depicted in these options encompass or occupy a portion of the parcels detailed in the following table:

□arcel □Ma□□ot□	□ddress	□cres □otal □arcel□	*Current □se*
54-441	60 Hodges Avenue	157.20 (Partial)	Municipal/Undeveloped Land
54-448	Dana Street	0.44	Vacant Land
54-449	Dana Street	0.45	Vacant Land
54-450	Dana Street	0.47	Vacant Land
54-451	Dana Street	0.48	Vacant Land
54-452	Dana Street	0.50	Vacant Land
54-453	Dana Street	0.49	Vacant Land
54-454	Dana Street	0.35	Vacant Land
54-455	Dana Street	0.35	Vacant Land
54-171	140 Dana Street	1.22	Telecommunications Facility
54-457	Railroad	N/A (Partial)	Railroad/Vacant Land

It should be noted that parcel 54-457 is a portion of the existing railroad right-of-way (ROW); however, the proposed station footprint options appear to make use of the vacant land in this parcel immediately to northeast of the existing tracks and the parcel is addressed in this memo. A Site location map showing the vicinity of the Site is provided as **Figure 1**. A Site plan depicting relevant Site features is provided as **Figure 2**.

Summary of Files Reviewed

Three disposal sites were identified on the Site or within close proximity and are detailed below.

Dana and Danforth Streets, Release Tracking Number (RTN) 4-11241

A release of fuel oil at 140 Dana Street from an underground storage tank (UST) was reported to MassDEP in March 1995 and assigned RTN 4-11241. Based on a review of available reports, the properties (and portion of the Site) assessed under RTN 4-11241 appears to encompass the City of Taunton Assessor's parcels Map 54, Lots 448 through 455 and Map 54, Lot 171 as displayed on **Figure 2**.

According to the Phase I Initial Site Investigation (ISI) prepared for RTN 4-11241 by Hermenau & Hermenau Consulting Engineers (HHCE) in 2006, two 10,000-gallon fuel oil aboveground storage tanks (ASTs), and one 1,000-gallon gasoline UST have been removed from the Site; however, one 500-gallon waste oil UST remained abandoned at the property (as of the date of the report).

Soil and groundwater testing conducted during the Phase I ISI revealed exceedances of the applicable regulatory reporting thresholds for extractable petroleum hydrocarbons (EPH), and volatile petroleum hydrocarbons (VPH) at the property. In addition, metals including arsenic, barium, cadmium, and lead were detected above the reporting thresholds; however, these contaminants were attributed to background and deemed not reportable to the MassDEP by HHCE. The Phase I ISI summarized proposed future response actions, which would ultimately result in closure of the disposal site. However, according to the MassDEP database, no reports have been submitted since the Phase I ISI in 2006, which indicates that the disposal site may not be in compliance with applicable regulations.

The presence of a potentially out-of-compliance disposal site on the Site suggests that contamination was identified on the Site and is a potential concern for the proposed project.

Tank #13 Cottage #8, 60 Hodges Avenue, RTN 4-13181

A release of No. 2 fuel oil discovered during the removal of a 1,000-gallon UST was reported to MassDEP in July 1997 and assigned RTN 4-13181. The disposal site achieved a Class A-2 RAO in September 2004, which indicates that contamination has not been reduced to background levels but a Condition of No Significant Risk has been achieved. The disposal site is located approximately 450 feet east of the Site. Based on proximity and response actions conducted, the disposal site is not expected to impact environmental media at the Site.

Former Nason Oil, 7 Perry Avenue, RTNs, 4-289 and 4-16050

A release of petroleum was discovered at 7 Perry Avenue in 1986 during an environmental assessment and assigned RTN 4-16050 in April 1987. A second release of petroleum discovered during the removal of an abandoned 500-gallon UST at 7 Perry Avenue was reported to MassDEP in February 2001 and assigned RTN 4-16050. The property has a long history of use for petroleum product storage between 1913 and 1986. Both disposal sites have achieved a Class A-2 Response Action Outcome (RAO), RTN 4-289 in November 1998 and RTN 4-16050 in February 2002. A Class A-2 RAO indicates that contamination has not been reduced to background levels but a Condition of No Significant Risk has been achieved. Based on the direction of groundwater flow and proximity to the Site, the disposal sites are not expected to impact environmental media at the Site.

Site History

The 1888 Sanborn map is the oldest record obtained during this review and depicts railroad tracks on and abutting the Site. According to the Phase I ISI prepared for RTN 4-11241 by HHCE in August 2006, the portion of the Site west of Dana Street has also has a history of use as an active freight yard (at least from the 1900s to 1980s), Agway retail (1950s to 1960s), Service Transport Company trucking business (1978 to 1996), and the temporary storage of bituminous concrete (1999). This portion of the Site also has a history of petroleum storage dating back to at least 1937. According to the 1937 Sanborn map, the portion of the Site west of Dana Street contained a feed house, motor oils store house, fuel oil tanks, offices, and a railroad yard. The majority of the Site is currently vacant and contains overgrown vegetation. A

telecommunications facility, including equipment and a metal tower is located in a fenced enclosure on the southernmost portion of the Site (see Figure 2).

Sanborn maps dating back to 1937 depict the portion of the Site on 60 Hodges Avenue (Map 54, Lot 441) as undeveloped land. Based on existing aerial imagery, this portion of the Site may have been used for agricultural purposes in the past.

According to the Sanborn maps, land immediately to the south of the Site (known as 28 Dana Street) was utilized for coal storage since at least 1888. The Staples Coal Company occupied the property sometime around 1893. By 1937, the Royal Coal Company occupied land south of the Site and contained twelve, 60 foot tall concrete coal silos, which remain. Sometime between 1937 and 1950 the property began being used as a scrap iron yard. This property, abutting the Site, is currently used as a scrap yard.

Conclusions

During a review of the MassDEP online database, available online Sanborn maps, and a drive-by Site reconnaissance, VHB identified the following environmental concerns for the Site:

- The Site is partially occupied by an active state-listed disposal site (RTN 4-11241). The disposal may be out-of-compliance with the applicable regulations and the lack of documentation online suggests that remedial actions have not been conducted to mitigate contamination identified and documented in the Phase I ISI report. Contaminants that exist at the Site above applicable regulatory standards include petroleum constituents and metals.

- The Site and abutting property to the south has a long history of industrial use. For example, the property at 28 Dana Street is currently used as a scrap yard. The Site itself was formerly utilized as a truck business, Agway distributor location, and for the temporary storage of bituminous concrete. The extent to which these industrial activities have impacted the Site is unknown.

- The portion of the Site on 60 Hodges Avenue appears to have always been undeveloped; however, the property may have been utilized for agricultural purposes. Pesticides or herbicides may have been utilized on the property and have the potential to impact environmental media at this portion of the Site.

- Finally, the portion of the Site west of Dana Street was formerly occupied by a railroad yard since at least 1888. Contaminants associated with former railroad operations include metals and semi-volatile organic compounds (SVOCs). Urban fill, which can contain metals and polycyclic aromatic hydrocarbons (PAHs) may have also been placed on the Site in order to fill in wetland areas. Finally, a vegetation control program may have been implemented in the railroad right-of-way and may have introduced lead, arsenic, and other pesticide/herbicide-related contaminants into Site soils.

In summary, the Site environmental media have the potential to be impacted by numerous sources related to industrial and agricultural uses. In addition, known contamination associated with the disposal site assigned RTN 4-11241 has been documented on the Site.

Prior to construction, it is recommended that a plan be developed to properly handle and manage Site soil and groundwater that may be contaminated, which would likely incorporate pre-characterization of media requiring management. Soils should be handled in a manner that protects the health and safety of workers, nearby receptors, and visitors to the Site. In addition, impacted soil and groundwater should be managed in accordance with applicable regulations and policies prior to leaving the Site, should export be required.

Executive Summary

ES-1 Introduction

Vanasse Hangen Brustlin, Inc. (VHB) was retained by the Massachusetts Department of Transportation (MassDOT) (the "Client") to conduct a Phase I Environmental Site Assessment (Phase I ESA) for the proposed Stoughton Station in the center of Stoughton, Massachusetts, located in Norfolk County, hereinafter referred to as the Site. The Site is being considered for potential acquisition and development during the South Coast Rail Project, which aims to restore passenger rail transportation from South Station in Boston to the South Coast of Massachusetts (the Project).

This Phase I ESA has been completed in general compliance with ASTM E 1527-05, *Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process* (the Standard) and generally conforms to the US Environmental Protection Agency's All Appropriate Inquiries guidance pursuant to regulations at 40 CFR Part 312. The Client is also the User of this report. Pursuant to Section 3.2.93 of the Standard, "the User has specific obligations for completing a successful application of this practice as outlined in Section 6" of the Standard.

The purpose of this Phase I ESA is to identify, to the extent feasible pursuant to the process described in the Standard, Recognized Environmental Conditions (RECs) in connection with the property. The Phase I ESA was completed utilizing the Standard as guidance.

The report should be read in its entirety to gain a comprehensive understanding of the findings presented in this Executive Summary.

ES-2 Site Location and Vicinity Description

The Site is located at 42°07'20" north latitude and 71°06'09" west longitude. The Universal Transverse Mercator (UTM) coordinates for the approximate center of the Site are 4,665,491 meters north and 326,202 meters east.

The Site consists of six parcels and totals 428,630 square feet (equivalent to 9.84 acres). The parcel identification obtained from the City of Stoughton Tax Assessor, address, acreage, and current use of each is provided in the following table.

Table ES-1 List of Parcels

Parcel (Map-Lot)	*Address*	*Acres*	*Current Use*
054-110	2 Canton Street	2.16	Business Park (Multiple Tenants)
053-102	25 Brock Street	4.42	Warehouse (Business Unknown)
054-401	48 Wyman Street	0.11	Vacant Store/Garage
054-407	Morton Street	0.20	Vacant Lot
054-406	Morton Square	1.90	Repair Garage/Industrial Storage Yard
053-101	25 Brock Street	1.05	Commercial (Communications Company)

The Site is located in a mixed use area of Stoughton, consisting of industrial, commercial and residential properties. A Site Location and Local Area Map showing the vicinity of the Site is provided as Figure 1. A plan depicting the Site and relevant site features is included as Figure 2.

ES-3 Records Review

VHB reviewed the Environmental Data Resources, Inc. (EDR) computer database search results, the Massachusetts Department of Environmental Protection (MassDEP) Waste Site Lookup database, and relevant municipal files for properties that have or could potentially environmentally impact the subject Site. Based on information obtained from these sources, VHB determined that a MassDEP file review was necessary. After reviewing select files during the MassDEP file review, it was determined that on-Site releases have occurred and nearby releases of oil and/or hazardous materials (OHM) have the potential to impact the Site. These releases are therefore discussed as RECs in Section 7.1.

ES-4 Site History Overview

Based on historical sources and previous environmental reports, the Site appears to have been developed since at least the late 1800s. As shown in Sanborn maps from 1885 to 1923, the property at 2 Canton Street was occupied by a rubber company, while the property at 48 Wyman Street was occupied by residential structures. In addition, the vacant land just off Morton Street (Parcel 054-507) appears to have been undeveloped during this time period. The properties at 25 Brock Street and off Morton Square were occupied by a lumber yard, dwelling, and horse sheds as shown in Sanborn maps from 1891 to 1906. A rubber company at 25 Brock Street and the Murphy Coal Company off Morton Square are first depicted in the 1923 Sanborn map. The Murphy Coal Company currently remains off Morton Square. By 1949, the property at 2 Canton Street was

utilized as a shoe manufacturing company, and 28 Wyman Street was vacant. The most recent Sanborn map from 1966 shows the 48 Wyman Street property occupied by a lumber storage building and the property at 25 Brock Street depicted as a shoe and latex manufacturer. Presently, the property at 2 Canton Street is occupied by a business park and parking area, while 25 Brock Street is occupied by a commercial business. The property at 48 Wyman Street is occupied by a vacant store/garage. The railroad tracks located adjacent to the Site have been in existence since the mid-1880s.

ES-5 Phase I Findings

The goal of the Phase I ESA is to identify RECs as defined by the Standard. This section identifies known or suspected RECs, historical RECs and potential environmental concerns (*de minimis* conditions). During the Phase I ESA, VHB identified nine RECs and three potential environmental concerns associated with the Site. VHB's opinion is limited by the conditions prevailing at the time the work was performed and the applicable regulatory requirements in effect.

To meet the requirements of Section 12.8 of the Standard, the statement below shall be included to preface the conclusions of this report.

"We have performed a Phase I Environmental Site Assessment in conformance with the scope and limitations of ASTM Practice E 1527 of 865 Central Avenue, the Site. Any exceptions to, or deletions from, this practice are described in Section 1.2 of this report. This assessment has revealed no evidence of recognized environmental conditions in connection with the property except for the following:"

Recognized Environmental Conditions

Nine RECs were identified during the Phase I ESA, as listed below. Detailed information on the identified RECs is provided in Section 7.1. The nine RECs include:

- 2 Canton Street, Former Use of the Property and On-Site Disposal Site (4-875, 4-18753, and RTN 4-21470,);
- Off 17 Morton Square, Murphy Coal Company, On-Site Automotive Repair, Petroleum Storage, and Disposal Site (RTN 4-13478);
- 25 Brock Street, Industrial Use of the Property and On-Site Disposal Site (RTN 4-13476);
- 48 Wyman Street, Use of Property as a Machine Shop;
- 931 Washington Street, Current Auto Repair and Former Filling Station (Off-Site);
- 24-46 Morton Street, Off-Site Chemical Company;
- 945 Washington Street, Active Drycleaning Business (Off-Site);
- 45 Wyman Street, Former Petroleum Storage at Stoughton Train Station (Off-Site); and

- 825 Washington Street, Nearby Disposal Sites and Former Filling Station (RTNs 4-12937, 4-11868, 4-13560, and 4-13682).

Potential Environmental Concerns

Three potential environmental concerns or *de minimis* conditions have been identified for the Site.

1) Based on the age of buildings, which may be demolished for the South Coast Rail project, asbestos containing materials, including roof flashing, tiles, and other materials, as well as lead based paint, may be present.
2) Due to the Site's densely developed location, close proximity to a railroad right-of-way and a long history of industrial and commercial use, urban fill may have been used to fill portions of the Site. Urban fill can contain metals and polycyclic aromatic hydrocarbons (PAHs) originating from coal/wood ash, tar, and/or slag.
3) Due to the close proximity of the railroad tracks and a suspected implementation of a vegetation control program in the vicinity of the railroad tracks, there is a possibility that lead, arsenic and other contaminants from pesticides are present in Site soil.

1 Introduction

1.1 Purpose and Scope of Work

Vanasse Hangen Brustlin, Inc. (VHB) was retained by the Massachusetts Department of Transportation (MassDOT) (the "Client") to conduct a Phase I Environmental Site Assessment (Phase I ESA) for the proposed Stoughton Station in the center of Stoughton, Massachusetts, located in Norfolk County, hereinafter referred to as the Site. The Site is being considered for potential acquisition and development during the South Coast Rail Project, which aims to restore passenger rail transportation from South Station in Boston to the South Coast of Massachusetts (the Project).

This Phase I ESA has been completed in general compliance with ASTM E 1527-05, *Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process* (the Standard) and generally conforms to US Environmental Protection Agency's guidance for All Appropriate Inquiries pursuant to regulations at 40 CFR Part 312. The Client is also the User of this report. Pursuant to Section 3.2.93 of the Standard, "the User has specific obligations for completing a successful application of this practice as outlined in Section 6" of the Standard.

The purpose of this Phase I ESA is to identify, to the extent feasible pursuant to the process described in the Standard, Recognized Environmental Conditions (RECs) in connection with the property. The Phase I ESA was completed utilizing the ASTM Standard as guidance. RECs are defined in the Standard as "*the presence or likely presence of any hazardous substances or petroleum products on a property under conditions that indicate an existing release, a past release, or a material threat of a release of any hazardous substances or petroleum products into structures on the property or into the ground, ground water, or surface water of the property. The term is not intended to include de minimis conditions that generally do not present a threat to human health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies.*"

The scope of services provided in the Agreement for the Phase I ESA includes the following:

- An inquiry by an "Environmental Professional" as defined in Section 312.21 of the All Appropriate Inquiries rule;

- Interviews with past and present owners, operators, and occupants, or abutters if the property is abandoned, in an effort to gather any specialized knowledge or experience with regard to the subject property;
- A review of historical sources, including, but not limited to, chain of title documents, aerial photographs, building department records, and land use records to determine previous uses and occupancy since first development;
- Searches for recorded environmental cleanup liens against the facility that are filed under federal, state or local law;
- A review of federal, state, or local government records; and
- A visual inspection of the facility and surrounding properties.

The scope of the Phase I ESA did not include a vapor intrusion evaluation or any environmental testing or sampling of soil, water, air, or soil vapor. Pursuant to Section 7.5.2.1 of the Standard, VHB was not required to independently verify information provided by others to complete the Phase I ESA.

1.2 Significant Assumptions, Limitations, Exceptions, and Data Gaps

VHB noted the following data gaps during this investigation:

- VHB was not able to interview the current or former key site managers who are likely to have a good knowledge of the uses and physical characteristics of the Site.
- The title documents for the Site were not reviewed.
- The User did not provide information as required by Appendix 3 of the ASTM Phase I ESA Standard.
- A site reconnaissance was not performed for the interior of the buildings located on the Site. The interior of the property located at 25 Brock Street could also not be viewed from public roadways and was not visited.

These data gaps could affect the findings of this report and where appropriate, have been conservatively incorporated as environmental concerns. However, upon obtaining the additional data, the findings may be re-evaluated.

1.3 Terms and Conditions

This Phase I ESA is subject to the terms of the agreement between VHB and the Client, and the Limitations included in Appendix A. Other than those limitations expressly provided in Appendix A and/or specified in Section 1.2, completion of the Phase I ESA was not subject to significant assumptions, limitations, or exceptions to the Standard.

1.4 User Reliance

This Phase I ESA was completed solely for Client (MassDOT) subject to the terms, conditions and limitations referenced herein and as issued in connection with the Agreement and the provisions thereof. Any use or reliance upon information provided in this report, without the specific written authorization of the Client and VHB, shall be at the User's sole risk.

This page intentionally left blank.

2

Site Description

2.1 Site Location and Description

The Site consists of six parcels and totals 428,630 square feet (equivalent to 9.84 acres). The parcel identification obtained from the City of Stoughton Tax Assessor, address, acreage, and current use of each parcel is provided below in the following table.

Table 2-1 List of Parcels

Parcel (Map-Lot)	Address	Acres	Current Use
054-110	2 Canton Street	2.16	Business Park (Multiple Tenants)
053-102	25 Brock Street	4.42	Warehouse (Business Unknown)
054-401	48 Wyman Street	0.11	Vacant Store/Garage
054-407	Morton Street	0.20	Vacant Lot
054-406	Morton Square	1.90	Repair Garage/Industrial Storage Yard
053-101	25 Brock Street	1.05	Commercial (Communications Company)

A Site Location and Local Area Map showing the vicinity of the Site is provided as **Figure 1.** A Site Plan depicting the Site and relevant site features is included as Figure 2.

2.2 Site and Vicinity General Characteristics

The Site is located in a mixed commercial, industrial, and residential area of Stoughton. The Site is situated around an active commuter rail station known as Stoughton Station. Topography at the Site is slopes gently upward to the northeast. Land on the southwestern portion of the Site is approximately ten feet below the nearby railroad tracks. The approximate elevation of the Site ranges from 210 feet above mean sea level at

the southwest corner, to 230 feet above sea level at the northeast corner. The nearest surface water body is Wood's Pond, which is located approximately 2,000 feet southwest of the Site. Wood's Pond is part of the Neponset River watershed.

2.3 Present Ownership and Current Use of the Property

The present ownership of each parcel comprising the Site is provided in the following table.

Table 2-2 Parcel Ownership

Parcel (Map-Lot)	Address	Ownership Information
054-110	2 Canton Street	Stoughton Center Business Park, LLC.
053-102	25 Brock Street	Juckett, M. & Corbett, T. Trustees Beta Realty Trust
054-401	48 Wyman Street	Quality Auto Parts of Stoughton C/O C. H. Beckford
054-407	Morton Street	Gouveia, Nelson E. & Kenneth; Hobson, Eileen
054-406	Morton Square	Murphy Coal Company, Inc.
053-101	25 Brock Street	Juckett, M. & Corbett, T. Trustees Beta Realty Trust

A business park, offices, warehouses, repair garage, and associated parking areas are located on the Site as noted in Section 2.1.

2.4 Description of Structures, Roads, and Other Site Improvements

The following table describes structures that are currently located on the Site parcels. The majority of the parcels are paved or covered with buildings. However; parcel 054-407 is unpaved and undeveloped. In addition, parcels 054-406, 053-102, and 053-101 are unpaved. Entrance to the parcels is off main roads, which include Morton Street, Brock Street, Wyman Street, and Canton Street.

Table 2-3 Description of Structures

Parcel (Map-Lot)	Address	Structures
054-110	2 Canton Street	One 33,819 square foot mill building, three stories, brick exterior, tar and gravel roof, constructed in about 1910, gas heat. One 12,699 square foot mill building, two stories, brick exterior, tar and gravel roof, constructed in about 1910, gas heat. One 26,699 square foot mill building, two stories, clapboard exterior, tar and gravel roof, constructed in about 1910, gas heat.
053-102	25 Brock Street	One 6,440 square foot commercial warehouse, one story, clapboard exterior, asphalt roof, constructed in 1925, oil heat. One 2,240 square foot commercial warehouse, one story, stone exterior, asphalt roof, constructed in 1910, oil heat. One shed (detailed information not available).
054-401	48 Wyman Street	One 4,611 square foot warehouse building, one story, corrugated steel exterior, membrane roof, constructed in 1960, oil heat.
054-407	Morton Street	Undeveloped land.
054-406	Morton Square	One 3,900 square foot, auto repair garage, one story, aluminum exterior, metal roof, constructed in 1950, gas heat.
053-101	25 Brock Street	One 19,458 square foot mill building, two stories, primarily brick exterior, tar and gravel roof, gas heat.

2.5 Current Uses of Adjoining Properties

The following properties and features surround the Site:

North

- MBTA-owned parking lot
- MBTA railroad tracks
- Route 27

East

- Historic Stoughton train station at 45 Wyman Street
- Portuguese National Club building and parking lot at 21 Railroad Avenue
- Warehouse located at 27 Railroad Avenue
- Vacant gas station at 825 Washington Street
- Auto repair shop at 931 Washington Street
- MBTA-owned parking lot and private lots
- Residential properties

South

- Stores at 945 Washington Street
- Residential properties

West

- Alpha Chemical Services of 24-46 Morton Street
- Demolished structure at 3 Morton Street
- Nightclub located at 63 Wyman Street
- St. Vincent De Paul Society at 18 Canton Street
- Residential properties

Properties located in the vicinity of the Site are used for industrial, commercial and/or residential purposes. A Local Area Map showing the vicinity of the Site and surrounding properties is provided as Figure 2.

3

User-Provided Information

3.1 Title Records

Title records were not reviewed for the Site. Historic property ownership and use were obtained from documents reviewed at municipal offices and other available environmental reports for the Site.

3.2 Environmental Liens or Activity and Use Limitations

The User did not provide information regarding environmental liens or Activity and Use Limitations relative to the subject Site.

3.3 Specialized Knowledge

The User did not provide information regarding any specialized knowledge relative to the subject Site.

3.4 Commonly Known or Reasonable Ascertainable Information

The User did not provide information regarding commonly known or reasonably ascertainable information regarding the Site.

3.5 Reason for Performing Phase I

This Phase I ESA was performed for property acquisition purposes.

3.6 Previous Environmental Reports

The User did not provide VHB with previous environmental reports pertaining to the Site. However, environmental reports pertaining to the Site were obtained through MassDEP and are summarized in Section 4.1.1.

4

Records Review

VHB conducted environmental database and municipal file reviews to help identify RECs on the Site and properties in the vicinity of the Site that have had a release or pose a threat of release of OHM that may impact the environmental quality of the Site. VHB reviewed federal and state environmental databases supplied by Environmental Data Resources, Inc. (EDR). VHB also conducted a targeted review of files available from MassDEP. The results of the records review are summarized below.

4.1 Standard Environmental Record Sources

EDR provided a report dated April 23, 2012, summarizing available and reasonably ascertainable information from standard environmental record sources at the minimum distances required in Section 8.2.1 of the Standard. A copy of the EDR report is provided in Appendix B, which includes a more detailed description of each database.

Sites with minimal address information that may be located in close proximity to the Site are listed separately in the database report as Orphan sites. A search was conducted of Orphan site locations to estimate distance and direction from the Site. Based on information contained in the EDR report and information derived from local maps, one of the listed Orphan sites is within the search radius of the Site and is discussed in Section 4.1.1. The remaining Orphan sites are not located within the search radius of the Site and/or are not likely to affect Site environmental media, including soil and groundwater quality; however, this determination was made with incomplete or limited information.

A summary of the EDR findings is described below.

- **National Priorities List (NPL); 1 mile** - A database operated by the EPA as an inventory of hazardous materials disposal sites that have been reported to the Federal government and been determined to be a priority for a Federal cleanup. No NPL sites were identified within the specified search radius.

- **Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS) Sites; 0.5 mile** - A database operated by the EPA as an inventory of potential hazardous materials sites that have been reported to the Federal government. No CERCLIS sites were identified within the search radius.
- Resource Conservation and Recovery Information System (RCRIS) under the Resource Conservation and Recovery Act (RCRA) includes the following databases:
  - **Corrective Action Sites (CORRACTS); 1 mile -** A database operated by the EPA as an inventory of hazardous waste treatment, storage and disposal facilities requiring a Federal oversight. One RCRA CORRACTS sites was identified within the specified search radius. Jet Line Services, Inc. of 441R Canton Street is located approximately 3,000 feet to the northwest of the Site and is therefore not expect to impact Site environmental media.
  - **Transportation, Storage Disposal Facility (TSD); 0.5 mile** - A database operated by the EPA as an inventory of hazardous waste treatment, storage and disposal facilities. No RCRA TSD sites were identified within the specified search radius.
  - **RCRA Generators (GN); Target Property and Adjoining Properties** - A database operated by the EPA as an inventory of hazardous waste generators who store hazardous waste on their properties. Two Conditionally Exempt Small Quantity Generators (CESQG) are located within the search radius at 931 Washington Street and 46 Morton Street. The property at 931 Washington Street is detailed is detailed in Section 4.1.1. Alpha Chemical Services of 46 Morton Street has been listed as a CESQG since 2004, and wastes transported from the property under manifest include lead, 1,1,1-trichloroethane, hydrofluoric acid, and dimethyl-benzene. The company manufactures acid sanitizer, disinfectants, mildew preventatives, and liquid chlorinating products. The presence of this company abutting the Site is discussed as a REC in Section 7. No Large Quantity Generators (LQG) or Small Quantity Generators (SQG) were listed on the database for the specified search area.
- **Emergency Response Notification System (ERNS); Target Property** - A database operated by the EPA as an inventory of hazardous materials or petroleum spills. The Site was not listed in the ERNS database.
- **Facility Index System (FINDS); Target Property** - A database operated by the EPA as an inventory of environmental permitted facilities (air, water, hazardous materials). The Site was not listed in the FINDS database.
- Toxic Chemical Release Inventory System (TRIS), Toxic Substances Control Act (TSCA), FIFRA/TSCA Tracking System (FTTS), Section 7 Tracking System (SSTS); target property - TRIS identifies facilities which release toxic chemicals to air, water and land in reportable quantities under SARA Title III. TSCA identifies manufacturers and importers of chemical substances included in the TSCA list. FTTS tracks administrative cases and pesticide enforcement actions and compliance related to the Federal Insecticide, Fungicide & Rodenticide Act

(FIFRA) and TSCA. SSTS tracks the types and amounts of pesticides being produced. The Site is not listed on these databases.

- **State Hazardous Waste Sites (SHWS) and Release Sites; 1 mile -** A database which shows information on releases of OHM that have been reported to the MassDEP and are on the Release List. A total of 42 SHWS sites were identified within a 1 mile radius of the Site. In addition, 58 Release sites were identified within 1 mile of the Site. Those properties that have the potential to adversely affect the Site are discussed in greater detail in Section 4.1.1. All remaining SHWS and Release sites are unlikely to have an adverse impact to the subject Site due to the distance, direction, nature and/or regulatory status.
- **Solid Waste Landfills (SWL); 0.5 mile** - A database of active and closed solid waste landfills. No SWL sites were identified within the specified search radius.
- **Underground Storage Tanks (UST); Target Property and Adjoining Properties -** A database of underground storage tank registered in the Commonwealth of Massachusetts. A total of two UST sites were listed in the specified search area at 825 and 931 Washington Street. These properties are described in Section 4.1.1.
- **Leaking Underground Storage Tanks (LUST); 0.5 mile** – A database of leaking underground storage tank facilities. A total of 46 LUST sites were identified within the specified search area. LUST properties that have a potential to impact environmental media at the Site are discussed in Section 4.1.1 below. All remaining LUST sites are not expected to adversely impact environmental media at the Site based on proximity to the Site.
- **Leaking Aboveground Storage Tanks (LAST); 0.5 mile** – A database of leaking aboveground storage tanks. Twelve LAST properties were listed within the specified search radius. Based on proximity to the Site and/or regulatory status, the LAST properties are not expected to impact environmental media at the Site.
- **Institutional Control Sites (INST CONTROL); Target Property and Adjoining Properties –** A database of sites with Activity and Use Limitations (AULs) which establish limits and conditions of the future use of a contaminated property. One INST CONTROL site was listed within the specified search radius. The on-Site AUL at 2 Canton Street is discussed in Section 4.1.1 below.
- **Drycleaners (DRYCLEANERS); 0.25 mile** – A listing of MassDEP's regulated dry cleaning facilities that use perchloroethylene under MassDEP's Environmental Results Program. One drycleaner was identified within the specified search radius. Pearl Cleaners of 945 Washington Street is located approximately 100 feet southeast of the Site and discussed in Section 7.
- **Other Databases** – There are many additional federal, state and local databases searched by EDR, including Brownfields, PCB Activity Database (PADS), Toxic Substances Control Act (TSCA), Formerly Used Defense Sites (FUDS), Manufactured Gas Plant database and others listed in the EDR report which is located in Appendix B. One manufactured gas plant and one Mines listed were noted in the report. Stoughton Gas and Electric was listed on School Street but is believed to be located approximately 350 feet north of the Site based on historic Sanborn maps. A quarry known as T. L. Edwards, Inc. involved the mining of

granite and is located over 1,000 feet west of the Site. Based on proximity, these properties are not expected to impact the Site. No other sites are listed within the specified search radius for the remaining databases.

4.1.1 Summary of Reports Reviewed at MassDEP

Available records were reviewed electronically on the MassDEP on-line file review database and in person at the MassDEP Northeast Regional Office. The MassDEP UST Query Tool was also searched online. Information obtained during the reviews is summarized below. Copies of relevant documents obtained during the MassDEP review are included in Appendix C.

Table 4-1 MassDEP File Review

Site Description	RTN	Summary
Old Factory/ Machine Shop 25R Brock Street	4-13476	November 1997: Release occurred and Immediate Response Action activities began May 1999: Class A-1 Response Action Outcome achieved August 1999: Class A-1 Response Action Outcome reaffirmed

Table 4-1 MassDEP File Review (continued)

Site Description	RTN	Summary
Market 31 Porter Street	4-17655	January 2003: Release occurred March 2003: Class A-1 Response Action Outcome achieved

4.1.1.1 Old Factory/Machine Shop, 25R Brock Street, RTN 4-13476

A disposal site at 25R Brock Street was assigned RTN 4-13476 in November 1997 for a release of approximately 15 gallons of No. 2 fuel oil. The release occurred when a 275-gallon AST tipped over and began leaking from a pipe. The Site at this time was utilized by several tenants for woodworking, a security business, a phone repair shop, and machine shop. An Immediate Response Action was conducted to excavate impacted soil (37 tons total), which was stockpiled on the property. No activities were conducted between November 1997 and May 1999. Soil samples were later collected in 1999, and the disposal site achieved a Class A-1 Response Action Outcome (RAO) in May 1999. The Class A-1 RAO indicates that contaminant concentrations were reduced to background and a Condition of No Significant Risk was achieved. The RAO was revised and resubmitted to MassDEP in August 1999 after an audit found that private wells were located within 500 feet of the Site. This finding did not change the report conclusions. The presence of a disposal site on the Site is discussed as a REC in Section 7.

4.1.1.2 J.F. Corcoran Shoe Company, 2 Canton Street, RTNs 4-875, 4-21470, 4-18753

A disposal site located at 2 Canton Street was assigned RTN 4-875 in April 1990 for a release of No. 6 fuel oil within the courtyard area of the property. The release was discovered during the removal of one 500-gallon gasoline UST and one 6,000-gallon No. 6 fuel oil UST in November 1989. Response actions included the soil and groundwater sampling, excavation of a former drywell, in-situ chemical oxidation, (ISCO) treatment, and contaminated soil excavation. RTN 4-21470 was assigned to the property for petroleum contamination discovered during the removal of an abandoned 3,000-gallon fuel oil UST, constituting a second disposal site. In addition, a third disposal site was assigned RTN 4-18753 in October 2004 for the detection of separate phase product in two piezometers. A Class A-3 RAO was achieved for all three disposal sites in October 2009. The Class A-3 RAO indicates that contaminant concentrations were not reduced to background levels, and a Condition of No Significant Risk is dependent upon the implementation of an AUL on the property. The disposal site encompasses the northern and central portions of the property. The AUL area encompasses the footprints of the buildings located on the northwestern half of the Site. The presence of a disposal site on the Site is considered a REC as discussed in Section 7.

4.1.1.3 Off 17 Morton Square, RTN 4-13478

A disposal site on the property behind 17 Morton Square (owned by Murphy Oil Company), was assigned RTN 4-13478 in November 1997 when a representative from MassDEP identified an oil-stained area and improperly stored waste oil at the property. A total of 2.68 tons of soil was excavated from the stained area, and confirmatory samples were collected. Waste oil being improperly stored was also removed from the property under a uniform hazardous waste manifest. The disposal site achieved a Class A-1 RAO in May 1998, which indicates that a Condition of No Significant Risk was achieved and contaminant levels were reduced to background. However, the disposal site is located on the Site and is therefore discussed as a REC in Section 7.

4.1.1.4 825 Washington Street, RTNs 4-11868, 4-12937, 4-13560, 4-13682

A disposal site at 825 Washington Street was assigned RTN 4-11868 in January 1996 for the detection of VOCs in the basement of the neighboring VFW building. A soil vapor extraction system was installed to mitigate the vapors, and a Class A-1 RAO was achieved in December 1996. A Class A-1 RAO indicates that contaminant levels were reduced to background and a Condition of No Significant Risk was achieved.

A second disposal site at the property was assigned RTN 4-12937 in January 1997 when an odor was again noticed in the basement of the neighboring building. Five USTs were removed from the property in 1997. Samples collected during the tank removal indicated that PAHs were present on the property above reportable concentrations and RTN 4-13682 was assigned to the property in February 1998. Finally, RTN 4-13560 was assigned to the Site in November 1997 when separate phase product was measured in one bedrock monitoring well installed at the property. These three RTNs are currently in Remedy Operation Status (linked under RTN 4-12937). According to reports reviewed for the disposal sites, the local groundwater flow direction varies, but generally appears to flow in an easterly direction. There is limited data between the source of petroleum and the Site, and in addition, PAHs were detected in soils on the western side of the gas station building (closest to the Site). The property containing the disposal site is located approximately 150 feet east of the Site. This disposal site is therefore discussed as a REC in Section 7.

4.1.1.5 Ruggiero & Son Inc., 931 Washington Street

According to the MassDEP online UST Query, the property at 931 Washington Street was formerly the location of a 3,000 gallon gasoline UST, which was installed in March 1947. The tank was constructed of steel and had no recorded leak detection or protection system. The property has also been permitted as a Conditionally Exempt Small Quantity Generator (CESQG) since 1986. Manifests have been used to document transportation of ignitable hazardous waste, such as petroleum distillates, from the property since this time. This property is located approximately 50 feet east of the Site.

In addition, the former presence of a filling station and petroleum storage at this location is discussed as a REC in Section 7.

4.1.1.6 Stoughton Center to 441 Rear Canton Street, RTN 4-22289

RTN 4-22289 was assigned to a release of diesel fuel, which occurred as a result of a mechanical failure within the engine compartment of a construction vehicle in November 2009. Between 10 and 25 gallons of fuel was released along 0.9 miles of roadway and remediated with absorbent materials. Although the release occurred on a roadway abutting the Site, based on a small amount of fuel released and regulatory status, the disposal site is not expected to impact the Site.

4.1.1.7 Former Sunoco, 990 Washington Street, RTNs 4-265, 4-18968 and 4-18650

A disposal site at 990 Washington Street was assigned RTN 4-265 in January 1987 when a release of petroleum compounds was detected in groundwater in two monitoring wells. A Class A-2 RAO was submitted for this disposal site in September 1994. A second disposal site at the property was assigned RTN 4-18650 in August 2004 for a release of petroleum constituents to groundwater. The release was designated a 72-hour reporting condition because several private wells were found to be located within 500 feet of the property. However, it was later determined that these wells were used for irrigation purposes only. A third release at the property was assigned RTN 4-18968 in February 2005. This release was detected during the removal of gasoline USTs, dispensers and piping at the property. The disposal sites associated with RTNs 4-18968 and 4-18650 achieved a Class A-2 RAO in August 2005, which indicates that concentrations of contaminants were not reduced to background levels but a Condition of No Significant Risk was achieved. The disposal site is located approximately 500 feet south of the Site. Analytical results of groundwater samples collected from monitoring wells between the Site and the disposal site were found to be below applicable regulatory thresholds, and therefore the disposal site is not expected to impact the Site.

4.1.1.8 Market, 31 Porter Street, RTN 4-17655

A disposal site at 31 Porter Street was assigned RTN 4-17655 in January 2003 for a release of approximately 50 gallons of diesel fuel from a delivery truck. Visibly impacted snow and ice was removed and absorbent materials were placed to clean up the spill. A Class A-1 RAO was achieved in March 2003. Based on the regulatory status and nature of the release, the disposal site is not expected to adversely impact environmental media at the Site.

4.2 Local Records Review

VHB personnel visited the Town of Stoughton municipal offices in April 2012 to review available files. The following is a summary of the files reviewed by department.

4.2.1 Assessor's Office

VHB obtained information regarding the Site from the Town of Stoughton Tax Assessor's. The following table describes the each parcel's identification, address, area, and current use as described on the property field cards.

Table 4-2 Assessor's Information

Parcel (Map-Lot)	Address	Acres	Current Use
054-110	2 Canton Street	2.16	Business Park (Multiple Tenants) and Parking Lots
053-102	25 Brock Street	4.42	Warehouse (Business Unknown)
054-401	48 Wyman Street	0.11	Vacant Store/Garage
054-407	Morton Street	0.20	Vacant Lot
054-406	Morton Square	1.90	Repair Garage/Industrial Storage Yard
053-101	25 Brock Street	1.05	Commercial (Communications Company)

The property field cards for the Site and associated assessor's map are included in Appendix D.

4.2.2 Fire Prevention Office

The Town of Stoughton Fire Prevention office was visited on April 26, 2012. Information was provided for the Site and abutting properties by Kathy McGrady, the Administrative Assistant, is summarized in this section.

25 Brock Street

Date	Document
6/15/1993	Tank removal record and application permit for one 15,000-gallon No. 4 fuel oil and one 10,000-gallon gasoline tank at Cain Manufacturing. Removal was performed by Hersee and transported by Enviro Product & Services to Mid City Scrap in Westwood, Massachusetts. No contamination is noted. Tank removal receipt was provided for the 10,000-gallon tank.
6/15/1993	Application for removal and tank disposal receipt for one 1,000-gallon gasoline tank. Removal to be conducted by Scott K. Hersee.
03/10/1999	Tank removal record for one 275-gallon aboveground tank. The record notes "Outside tank removal for placement of new tank. Staining on ground from previous problems with this location. This tank seemed to have no leaks." Tank disposal receipt was provided.
10/14/2000	Tank removal record for one 275-gallon steel aboveground tank from a rear deck. No contamination is noted. Tank disposal receipt was provided.

2 Canton Street

Date	Document
11/17/1989	Record of tank removal for one 500-gallon gasoline and one 5,000-gallon tank of unknown product. Removal conducted by J.F. McNamara. The permit does not indicate whether any notifications were made to MassDEP for contamination. Tank disposal receipts were provided.
11/13/1992	Record of tank removal for one 10,000-gallon No. 4 fuel oil tank from the Corcoran Shoe factory conducted by Clean Harbors. No indication of contamination. Tank disposal receipt was provided.
8/26/2008	Application for removal of a 3,000-gallon No. 6 fuel oil tank from Stoughton Center Business Park conducted by Cyn Environmental. Woodard and Curran was the consultant and RTN 4-21470 was assigned for contamination.

17 Morton Square (Murphy Coal Co.)

Date	Document
None	Record of storage tanks at this location. Three 15,000-gallon and two 10,000-gallon ASTs. Contents not noted.

3 Morton Square (New England Furniture)

Date	Document
1/3/1997	One 1,000-gallon tank. Contents not noted. Tank disposal receipt provided.

42 Morton Street (Alpha Chemical Company)

Date	Document
5/17/1993	Application for the removal of one 1,000-gallon fuel oil tank. Tank disposal receipt was provided.

45-47 Wyman Street (Historic Stoughton Train Station)

Date	Document
1/3/1997	Record of removal and application for removal for four 330-gallon above ground No. 2 heating oil tanks. Tank disposal receipts were provided.

26 Brock Street (Across the Street from 25 Brock Street)

Date	Document
8/11/1993	Tank removal record and application for 500-gallon fuel oil tank. No notation on permit regarding contamination. Tank disposal receipt was provided.

4.2.3 Zoning/Planning/Engineering Department

During a visit to this office on April 25, 2012, VHB was provided with the two tax maps applicable to the Site (numbers 53 and 54). The zoning for each parcel was noted from the original tax maps as follows.

Table 4-3 Tax Map Information

Parcel (Map-Lot)	*Address*	*Zoning*
054-110	2 Canton Street	General Business
053-102	25 Brock Street	Industrial
054-401	48 Wyman Street	Central Business District
054-407	Morton Street	Industrial
054-406	Morton Square	Industrial
053-101	25 Brock Street	Industrial

In addition, the Town Engineer provided VHB with sewer connection diagrams pertaining to selected parcels. Based on these diagrams, the property at 48 Wyman Street appears to have been connected to the Town sewer system in 1961. Sewer diagrams were provided for 25 Brock Street dated January 1983, and 2 Canton Street dated August 2004. However; these later records may pertain to connections that were altered or repaired. The Environmental Affairs Officer in Stoughton also stated that a sewer pipe running through the 25 Brock Street property was retro-fitted with a sleeve as a repair at one point in time. An engineer for the Town stated that the central portion of Stoughton where the Site is located is served by municipal sewer.

The Town's Environmental Affairs Officer, James B. Conlon, stated that there are state-listed hazardous waste sites located in the vicinity of the Site. He was not aware of any recent filling activities in the area, but he believes that there are wetlands located in the forested area behind 25 Brock Street.

4.2.4 Board of Health

There were no files pertaining to environmental conditions at the Site at the Stoughton Board of Health office. A café located at 2 Canton Street is permitted by the Board. Information pertaining to the drinking water supply is contained in Section 4.2.6.

4.2.5 Building Department

The Stoughton Building Department was visited on April 25, 2012. A file was available for parcels of the Site that have specific numbered addresses. The majority of permits did not pertain to environmental concerns at the Site and included remodeling, plumbing, electrical, or sign permits. The following permits were reviewed regarding environmental conditions at the Site:

- October 26, 1979 letter from Stoughton Fire Prevention summarizing inspection findings at 25 Brock Street. Noted that a rear building with 'Rick's Kitchen' as tenant had an oil burner and oil storage in violation of CMR 4.00 and Fire Prevention Regulation #3 including an improper chimney.
- October 30, 1979 letter from Building and Zoning stating that the venting of the oil burner at 25 Brock Street was not a proper, safe installation.
- December 23, 1991 application for permit to perform electrical work at Murphy Coal (off 17 Morton Square). Proposed electrical work was "to install new service for fuel pumps."
- July 23, 1992 permit for 27-29 Wyman Street, noted as Railroad Station, to install conversion burners in the basement.
- Undated plan of 2 Canton Street depicting floor plan. A 2,500 gallon fuel oil tank, gas pump, 500-gallon gasoline tank, and three transformers are depicted on the property.

4.2.6 Water and Sewer

According to Stoughton Department of Public Works records, properties located within the vicinity of the Site are serviced by municipal water and sewer, private drinking water wells, and/or septic systems. Potable wells are located on Morton Street, within 500 feet of the Site, as noted in other environmental reports and the EDR Radius Report.

A portion of properties in the vicinity of the Site are believed to be serviced by the Stoughton municipal water supply, which is acquired from seven public wells on the western boundary of the Town. In addition, the Town purchases water from the Canton, Easton, and Sharon water departments.

As noted in Section 4.2.3, the Town Engineer had records of municipal sewer connection for 2 Canton Street, 25 Brock Street, and 48 Wyman Street. In addition, a non-potable well is located at 2 Canton Street (and has been located at the Site since the 1880's according to Sanborn maps). According to available environmental reports, the property at 2 Canton Street is serviced by municipal water. There are no Zone II public drinking water supplies located within a quarter mile of the Site.

4.2.7 City Clerk's Office

During the municipal file review on April 25, 2012, the Town Clerk provided VHB with a folder of all commercial petroleum storage permits in the Town. One permit pertaining to the Site was found. The permit was dated March 19, 2012 and allows Murphy Coal & Oil to use the buildings and structures located at Morton Square for the "keeping, storage, manufacture, or sale of flammables, combustibles, or explosives."

4.2.8 Summary of Records Review

VHB reviewed the EDR computer database search results, MassDEP Waste Site Lookup database, and relevant municipal files for properties that have or could potentially impact environmental conditions at the subject Site. Based on information obtained during the Phase I ESA, VHB determined that a MassDEP file review was necessary. After reviewing select files during the MassDEP file review, it was determined that potential and documented releases of OHM at the Site and nearby properties have the potential to impact the Site. The potential/documented releases of OHM are therefore discussed as RECs in Section 7.1.

4.3 Physical Setting Sources

The following section describes the physical resources of the project Site including topography, soils and surficial geology, bedrock geology, groundwater, wetlands, surface water, and floodplains.

4.3.1 Topography

The topography of the Site is generally flat with the exception of an approximately ten foot difference between the railroad tracks and parcels located on the southwest portion of the Site (25 Brock Street and Morton Square). Land surrounding the Site slopes gradually upward to the northwest, and gradually downward to the southwest toward Wood's Pond. The Site has a mean elevation of 225 feet above sea level.

4.3.2 Soils/Surficial Geology

According to the U.S. Department of Agriculture's (USDA) National Cooperative Soil Survey (NCSS) information, the majority of the Site is mapped as urban land. The southwestern portion of the Site may consist of the Walpole soil layer, which is a poorly drained sandy loam with slow infiltration rates. Land to the east and west of the Site consists of the Merrimac soil layer, which is a somewhat excessively drained fine sandy loam with high infiltration rates.

4.3.3 Bedrock Geology

According to the Bedrock Geology Map of Massachusetts by E-an Zen (1983), the bedrock for the Site vicinity is mapped as Dedham Granite, which is a light grayish-pink to greenish-grey, equigranular to slightly porphyritic, variably altered, granite south and west of Boston.

4.3.4 Groundwater

According to the Massachusetts Geographic Information System (MassGIS) Site Scoring Map dated April 23, 2012 and provided as Figure 3, the Site is not located within any current or potential drinking water sources, including EPA sole source aquifers, medium or high yield aquifers, Zone II or Zone A drinking water protection areas or Interim Wellhead Protection Areas (IWPAs).

Groundwater flow direction may be affected by surface topography and subsurface hydrogeologic characteristics. Based on surrounding topography, the groundwater flow direction at the Site is inferred to flow from the northeast to the southwest.

4.3.5 Wetlands

A small wetland is depicted on the Site in the MassGIS Site Scoring Map (Figure 3). In addition, the map also shows wetlands and a FEMA 100-year floodplain immediately to the south of the Site across Brock Street.

4.3.6 Surface Water

The nearest surface water body is Wood's Pond, which is located approximately 2,000 feet southwest of the Site. Wood's Pond is part of the Neponset River watershed. It should also be noted that Mead's Meadow is located approximately 700 feet southeast of the Site, and appears to sometimes contain standing water based on aerial photographs.

4.3.7 Floodplains

According to the Flood Insurance Rate Map (FIRM) for the Town of Stoughton, Massachusetts, Norfolk County, dated June 1, 1982 (Map Number 2502530001B), the Site is located in "Zone C", which pertains to areas of minimal flooding. The FIRM is included in **Appendix D**.

4.4 Historical Use Information

The following sections describe the historical use information that is evident on Sanborn maps, topographic maps, and aerial photography.

4.4.1 Sanborn Maps

Sanborn maps are a uniform series of large-scale detailed maps dating from 1867 through 1991 that depict the commercial, industrial, and residential sections of cities. These maps historically assisted fire insurance agents in determining the degree of hazard associated with a particular property. Sanborn maps are currently used to track the changing site conditions and property uses.

The Sanborn library was searched by EDR. Sanborn maps dated 1885, 1891, 1896, 1901, 1906, 1912, 1923, 1949, and 1966 were available for the Site and surrounding properties. Copies of the Sanborn maps are provided in Appendix E. A summary of the maps is provided below:

Year: 1885

This map depicts the property at 2 Canton Street as Mystic Rubber (rubber clothing company), powered by steam heat and coal fuel. The factory includes several buildings for grinding, spreading fabric, coat making, and storage. The southeastern

half of the property appears to be undeveloped with the exception of a small railroad spur. Several smaller buildings are located in the vicinity of the property at 48 Wyman Street, which include a two-story dwelling, gentleman's hall, and railroad passenger station. The railroad tracks are depicted in a similar location as they currently exist, except there are three sets of tracks labeled the Old Colony Railroad. The western half of the property off of Morton Square and Brock Street is not depicted in this map. However; a vacant dwelling, lumber storage, wagon shed, and lumber piles are shown on the eastern half of the property.

Years: 1891, 1896, and 1901

The 1891 map depicts 2 Canton Street as the Stoughton Rubber Company. A two and a half story freight house occupies the southeastern half of the property. The property at 48 Wyman Street is occupied by a two story dwelling. Land to the south of 48 Wyman Street and east of the Railroad Avenue properties is occupied by an Engine House and Turn Table (not located on the Site). The southwestern portion of the Site off Morton Square and Brock Street is occupied by the Samuel Paul Lumber Yard, which includes lumber sheds and storage. The 1896 map is generally similar to the 1891 map, except a horse shed, store house, and dwellings are shown on the property at 25 Brock Street. The 1901 maps are similar to the 1896 maps.

Year: 1906

The 2 Canton Street property is depicted as the Stoughton Rubber Co. in this map. The locations of buildings at the property are similar to those shown in earlier maps. The property at 48 Wyman Street continues to be occupied by a dwelling. Vacant sheds and storage occupied the properties off Morton Square and Brock Street at the southwestern portion of the Site. In addition, there are about six or seven sets of railroad tracks abutting the Site, in comparison to three in the previous map. The property off Morton Street appears to be vacant, although the street name shown for this property on the map is Summer Street.

Year: 1912

The 2 Canton Street property in this map continues to be occupied by the Stoughton Rubber Company. The smaller buildings on the northern and western portions of the property have been replaced by large mill buildings. The company includes stitching and folding rooms, shipping, heater rooms, and cutting rooms. The property continues to utilize steam and coal energy. The property at 48 Wyman Street remains unchanged from previous maps. Summer Street has been labeled Morton Square on the eastern side of the Morton Street property. The properties on the southwestern portion of the Site are occupied by sheds and a wagon house (the lumber yards are no longer present).

Year: 1923

In the 1923 map, the properties at 2 Canton Street and 48 Wyman Street remain unchanged from previous maps. However; the property at Morton Square is occupied by the Murphy Coal Co. Inc., which includes a coal shed, lumber shed, and scales. The 25 Brock Street property is occupied by the Meade Rubber Company, manufacturers of heels and rubberized cloth. The facility includes steam heat, coal fuel with a vulcanizer, two buried petroleum tanks, engine room, and mill room. A smaller gas tank is also shown at the front of the property closest to Brock Street. The former presence of petroleum storage at the Site is discussed in Section 7.

Year: 1949

In the 1949 map, the property at Morton Square (Murphy Coal Co.) remains unchanged. The southwester portion of 2 Canton Street continues to be occupied by a factory, which is now called the Joseph F. Corcoran Shoe Company. The facility has eleven types of rooms for shoe-making, but the building is in the same configuration as in previous maps. The property at 48 Wyman Street is vacant (no buildings present). The property at 25 Brock Street is occupied by L. Albert & Son used rubber machinery. The building is generally the same as in the 1923 map, except two additional larger warehouses have been constructed to the northwest (similar to those currently present on the Site).

Year: 1966

In the 1966 map, the factory at 2 Canton Street is still a shoe manufacturer. Based on recent aerials, it appears that this parcel was subdivided after this time, because the current property configuration shows the parcel boundary at the edge of buildings 1, 10, and 9. The southeastern half of the property is occupied by a parking lot. The property at 48 Wyman Street is occupied by a lumber storage building. A filling station is located east of the Site on Washington Street (off-Site). The Murphy Coal Co. on Morton Square is similar to the 1949 map, except five large fuel oil tanks are located at the center portion of the property. The property at 25 Brock Street is utilized for manufacturing shoe materials and latex. The facility buildings are used for storage, and engine room, and offices. Two buried petroleum tanks are still shown on the property. On the opposite side of the railroad tracks, at the corner of Brock Street and Washington Street is an auto repair facility with filling station (off-Site).

4.4.2 Topographic Maps

Historical U.S. Geological Survey (USGS) topographic maps showing the Site for the years 1894, 1941, 1948, 1951, 1958, 1963, 1971, 1975, 1979, and 1985 were obtained from EDR and reviewed. Copies of the historical topographic maps are included in Appendix F.

Beginning in the 1894 map, railroad tracks are shown running through the center of the Site. The Site is located in a moderately developed area of Stoughton (Stoughton

Center) and all roads that are used to access the Site currently are depicted. The 1941 map depicts the factory on 25 Brock Street, and also shows a wetland area on the southwestern corner of the Site. This wetland area is present up until the 1975 map. The remaining maps do not show any significant Site features such as buildings, but do depict the area surrounding the Site as moderately developed. Railroad tracks are depicted on all maps.

4.4.3 Aerial Photography

VHB personnel obtained and reviewed aerial photographs from EDR dated 1957, 1961, 1969, 1974, 1978, 1985, 1991, 1996, 2006, and 2008 for the Site and vicinity. Copies of the aerial photographs are included in Appendix G.

The 1957 photograph shows 48 Wyman Street as a vacant property. The Murphy Coal Oil property on Morton Square appears to not contain any large trees and is primarily occupied by a warehouse building and a row of five ASTs. The property at 25 Brock Street is shown as a facility with several buildings. There appears to be a ditch to the west of the facility that may contain standing water. Two Canton Street generally appears similar to its present configuration. The building at 48 Wyman Street first appears in the 1969 photograph. By 1978, the Site and Site features generally match their current appearance. The Murphy Coal Oil property becomes increasingly vegetated as the photographs progress to the present day. The 1996 map shows a parking area has been constructed on the Railroad Avenue properties, and the Murphy Coal Company appears to be storing an increasing amount of trailers/machinery on their property. The 2006 and 2008 photographs are very similar to the present day appearance of the property.

4.5 Site History Overview

Based on historical sources and previous environmental reports, the Site appears to have been developed since at least the late 1800s. As shown in Sanborn maps from 1885 to 1923, the property at 2 Canton Street was occupied by a rubber company, while the property at 48 Wyman Street was occupied by residential dwellings. In addition, the vacant land just off Morton Street (Parcel 054-507) appears to have always been undeveloped. The properties at 25 Brock Street and off Morton Square were occupied by a lumber yard, dwelling, and horse sheds as shown in Sanborn maps from 1891 to 1906. A rubber company at 25 Brock Street and the Murphy Coal Company off Morton Square are first depicted in the 1923 Sanborn map. The Murphy Coal Company currently remains off Morton Square. By 1949, the property at 2 Canton Street was utilized as a shoe manufacturing company, and 28 Wyman Street was vacant. The most recent Sanborn map from 1966 shows the 48 Wyman Street property occupied by a lumber storage building and the property at 25 Brock Street depicted as a shoe and latex manufacturer. Presently, the property at 2 Canton Street is occupied by a business park and parking area, while 25 Brock Street is occupied by a commercial business. The property at 48 Wyman Street is occupied by

a vacant store/garage. The railroad tracks located adjacent to the Site have been in existence since the mid-1880's.

5

Site Reconnaissance

5.1 Methodology and Limiting Conditions

A Site reconnaissance was conducted by Katherine Kudzma and Paul McKinlay of VHB on April 26, 2012 for visual and reasonably identifiable indications of RECs as defined by ASTM E 1527-05 and All Appropriate Inquiries guidance. Interior portions of the Site buildings were not accessed. Information obtained at the time of the site reconnaissance is presented in the following sections.

There were no limiting weather conditions at the time of the site reconnaissance. Photographs taken during the site visits are provided in Appendix H.

5.2 General Site Setting

The Site is located in Stoughton center and accessed via Morton Square, Wyman Street, Canton Street, Morton Street, and Brock Street. The area surrounding the Site is located in a developed, mixed use (commercial, industrial and residential) area of Stoughton. The Town of Stoughton is located in Norfolk County, approximately 16 miles south of the City of Boston.

5.3 Exterior Observations and Surface Conditions

Exterior observations of each parcel comprising the Site are summarized below. VHB personnel did not note any odors, pools of liquid, stains or corrosion, ponds or lagoons, stressed vegetation, or other observable feature of note, other than those specifically described herein.

2 Canton Street (Parcel 054-110)

The property at 2 Canton Street is currently occupied by the Trackside Plaza, a commercial business park. The southeastern half of the property is an asphalt paved

parking area. A portion of the parking lot was utilized for commuter parking associated with the abutting train station, while the portion of the lot closest to the building on the property was customer parking. The lot appeared to be in good condition and recently paved. Businesses within the large building on the property include the "Salon Sundara" beauty salon, "Padhale Deli Polish Food," "Praise Academy" dance school, "Why Weight Fitness" gym, "CV Café," "Henson Jackson" art gallery, "New England Martial Art," "Co Graphics & Signs," "Pattavina Networks" computer repair, "Sha'ar Hashmayim Messianic Congregation," "Mad Al's Doghouse" café, and "Berlus Realty." The building is comprised of several units, which appear to be connected by indoor walkways. A large smokestack is located in the central portion of the building. Portions of the Site not covered by the building are asphalt paved.

25 Brock Street (Parcel 053-102 and 053-101)

The parcel at 25 Brock Street is occupied by three buildings. The warehouse-style buildings on the central portion of the Site appeared to be one-story and in poor condition. Overhead electric wires run through the parcel, and several pole-mounted transformers were noted. A large brick mill-style building abuts Brock Street and appears to be occupied by commercial tenants. The tenants of the building could not be determined due to property access restrictions. The area in front of the building was asphalt-paved with small landscaped area. Loading docks are located on the western portion of the building. A dirt access road runs along the eastern side of the building.

48 Wyman Street (Parcel 054-401)

The parcel located at 48 Wyman Street is primarily occupied by a one-story building with corrugated steel exterior. A small shed was also noted on the northern portion of the Site. Signs on the building stated "Quality Auto Parts Automotive Finishes," "NAPA Auto Parts," and "Machine Shop Service, Truck-Auto-Marine, Foreign and Domestic." The building was vacant at the time of the Site visit and windows were covered with paper from the inside. The building has a large garage door on the southern face. In addition, several small areas of concrete and asphalt paving surrounded the building. Two large electric boxes, one of which may be associated with the abutting train station, were located against the western building face. Three pole-mounted transformers were noted at the property's western corner.

Morton Square (Parcel 054-406)

This parcel, owned by Murphy Coal Oil Company, is accessible via Morton Square, Brock Street, or Morton Street. VHB was not able to walk around the interior of the parcel; however, observations were made from the parcel boundaries. The parcel contains large piles of gravel, cut trees, wood pieces, and sand. Vehicles were scattered throughout the property and included a large snow plow, fuel delivery vehicle, and at least five pieces of heavy equipment. Five ASTs were noted at the central portion of the parcel. The tanks were grey, painted steel and there was a small concrete wall surrounding the tanks of unknown condition, which may have been

constructed as a secondary leak containment structure. The parcel does not appear to be paved. The ground surface appeared to be a dark grey color in some locations, which may be unnatural and caused by the former use of the property for coal distribution. A warehouse style building is located on the eastern side of the parcel and could not be accessed.

5.3.1 Polychlorinated Biphenyls

At the time of the site reconnaissance, several pole-mounted electrical transformers were observed throughout the Site. Pad-mounted transformers were noted at the 2 Canton Street and 48 Wyman Street properties. VHB did not observe any other materials or structures indicating the presence of polychlorinated biphenyls at the Site.

5.3.2 Monitoring Wells

One monitoring well was observed at 2 Canton Street on the eastern side of the property.

5.3.3 Storage Tanks and Subsurface Utilities

Storage tanks were observed during the site reconnaissance at the Murphy Coal Company property. Five large ASTs are present at the central portion of this parcel. As indicated on the property field cards, several of the Site parcels may be heated with oil and not have gas service. In general, electric service appeared to consist of overhead wires.

5.3.4 Adjacent Properties

During the Site reconnaissance, VHB observed the following abutting/adjacent properties that may have the potential to impact environmental media at the Site:

- Former gasoline filling station at 825 Washington Street;
- Automotive Repair at 931 Washington Street;
- Pearl Cleaners (dry cleaning) at 945 Washington Street; and
- Alpha Chemical Services, Inc. of 42 Morton Street (manufacturers of cleaning and sanitizing products).

The potential for these properties to impact the Site is discussed in Section 7.

5.4 Interior Observations

A site reconnaissance of the interior of the buildings was not conducted.

5.4.1 Floor Drains and Sumps

The interior of the buildings was not observed; therefore, the presence of floor drains and sumps is unknown.

5.4.2 Hazardous Materials/Petroleum Products Storage, Handling, and Staining

VHB did not observe any hazardous materials, petroleum products or staining at the Site; however, the interior of the Site building was not observed.

5.4.3 Storage Tanks

Evidence of interior storage tanks was not observed during site reconnaissance.

6 Interviews

6.1 Interview with Owner, Site Manager/Occupants, or Knowledgeable Person

An interview with the owner, site manager/occupants, or knowledgeable person was not conducted and is discussed as a data gap in Section 1.2.

6.2 Interviews with Local Government Officials

During the municipal file reviews conducted in April 2012, the Town of Stoughton municipal employees from select departments were asked for information regarding the Site. This information has been included in the municipal file review portion (Section 4.2) of this report.

This page intentionally left blank.

7

Findings and Conclusions

The goal of the Phase I ESA is to identify RECs as defined by the Standard. This section identifies known or suspected RECs, historical RECs and potential environmental concerns (*de minimis* conditions). During the Phase I ESA, VHB identified nine RECs and three potential environmental concerns associated with the Site. VHB's opinion is limited by the conditions prevailing at the time the work was performed and the applicable regulatory requirements in effect.

To meet the requirements of Section 12.8 of the Standard, the statement below shall be included to preface the conclusions of this report.

"We have performed a Phase I Environmental Site Assessment in conformance with the scope and limitations of ASTM Practice E 1527 of 865 Central Avenue, the Site. Any exceptions to, or deletions from, this practice are described in Section 1.2 of this report. This assessment has revealed no evidence of recognized environmental conditions in connection with the property except for the following:"

7.1 Recognized Environmental Conditions

Nine RECs were identified during the Phase I ESA, as described in this section and summarized in Table 7-1.

Table 7-1 Identified Recognized Environmental Conditions

Address	Site Description	RTN	Rationale
2 Canton Street	Former Use of the Property and On-Site Disposal Site	4-875 4-18753 4-21470	Former petroleum storage Industrial uses Existing contamination
Off 17 Morton Square	Murphy Coal Company On-Site Automotive Repair, Petroleum Storage, and Disposal Site	4-13478	Industrial uses Record of environmental contamination
25 Brock Street	Industrial Use of the Property and On-Site Disposal Site	4-13476	Industrial uses Former petroleum storage Presence of on-Site disposal site
48 Wyman Street	Use of the Property as a Machine Shop	--	Inaccessible property Unknown status of storage tanks Historical use of property
931 Washington Street	Current Auto Repair and Former Filling Station	--	Former and current use of property
24-46 Morton Street	Off-Site Chemical Company	--	Storage of chemicals and petroleum
945 Washington Street	Active Drycleaning Business	--	Use of chemical solvents at the property
45 Wyman Street	Former Petroleum Storage at Stoughton Train Station	--	Former petroleum storage
825 Washington Street	Nearby Disposal Sites and Former Filling Station	4-12937 4-11868 4-13560 4-13682	Four identified releases at property Lack of information regarding groundwater flow Presence of a plume of petroleum constituents in groundwater

7.1.1 2 Canton Street Former Use of Property and On-Site Disposal Site (RTNs 4-21470, 4-875, and 4-18753)

A disposal site located at 2 Canton Street was assigned RTN 4-875 for a release of petroleum discovered during the removal of two underground storage tanks (USTs) in 1989. A second disposal site was assigned RTN 4-21470 for petroleum contamination discovered during the removal of an additional UST. A third disposal site was assigned RTN 4-18753 in October 2004 for the detection of separate phase product in two piezometers. The presence of contamination is associated with the industrial uses of the property, which have included operation by the Mystic Rubber clothing company, Stoughton Rubber Company, and Joseph F. Corcoran Shoe

Company. A Class A-3 Response Action Outcome (RAO) was achieved for all three disposal sites in October 2009, which indicates that contaminant concentrations were not reduced to background, and a Condition of No Significant Risk is dependent upon the implementation of an activity and use limitation (AUL) on the property. The former petroleum storage, industrial uses, and existing contamination on the Site are deemed a REC.

7.1.2 Off 17 Morton Square Murphy Coal Company, On-Site Automotive Repair, Petroleum Storage, and Disposal Site (RTN 4-13478)

An on-Site disposal site on the property off Morton Square owned by Murphy Oil Company was assigned RTN 4-13478 in November 1997 when a representative from MassDEP identified an oil-stained area and improperly stored waste oil at the property. The disposal site achieved a Class A-1 RAO in May 1998, which indicates that a Condition of No Significant Risk was achieved and contaminant levels were reduced to background.

According to Sanborn maps, the property has been occupied by Murphy Coal Company since at least 1923, and formerly contained a coal shed and scales. The company is currently permitted for three 15,000-gallon and two 10,000-gallon above ground storage tanks (ASTs) associated with the sale and distribution of fuel oil. The ASTs have been present since at least 1957 according to historic aerial photographs and the current condition of the tanks is unknown. The assessor's card also indicates that the property is used as an automotive repair garage. Former repair operations at the property may have required the use of OHM including petroleum products, solvents, and other OHM. These OHM have the potential to contaminate environmental media when not handled or disposed of properly. In addition, during the Site reconnaissance, several piles of fill (gravel, sand, stumps), and pieces of heavy machinery were also observed on the property. The origin of the fill material is unknown, and machinery can leak petroleum or fluids to the environment when not properly maintained. These industrial uses of the property and record of environmental contamination are deemed a REC.

7.1.3 25 Brock Street Former Use of the Property and On-Site Disposal Site (RTN 4-13476)

The two Site parcels with an address of 25 Brock Street have an extensive history of industrial uses, including operation by the Meade Rubber Company in the early 1900s, L. Albert & Son rubber machinery in the mid-1900s, and a latex and shoe materials manufacturer around 1966. According to recent environmental reports, the property has also been used as a machine shop. According to the Fire Department, five petroleum ASTs have been removed from the Site. No information was available regarding the condition of the tanks or analytical testing of the surrounding

environmental media. Furthermore, a complaint was filed by the Fire Department in 1979 noting an oil storage violation at the property. According to the assessor's cards, two of the Site buildings are currently heated with oil.

In addition, a disposal site located at 25R Brock Street was assigned RTN 4-13476 in November 1997 for a release of approximately 15 gallons of No. 2 fuel oil. The release occurred when a 275-gallon AST tipped over and began leaking from a pipe. The disposal achieved a Class A-1 Response Action Outcome (RAO) in August 1999, which indicates that contaminant concentrations were reduced to background and a Condition of No Significant Risk was achieved. The industrial uses of the property, former petroleum storage, and presence of an on-Site disposal site are deemed a REC.

7.1.4 48 Wyman Street Former Use of the Property as a Machine Shop

The property at 48 Wyman Street comprises a portion of the Site, and was formerly used for the sale of automotive parts, and as a machine shop. Former repair operations at the property may have required the use of OHM including petroleum products, solvents, and other chemicals. These OHM have the potential to contaminate environmental media when not handled or disposed of properly. In addition, the property is noted by the assessor's to be heated with oil and the condition of any storage tanks at the property is unknown. VHB was unable to access and observe the interior of the building located on the Site and has conservatively assumed that a REC is present associated with former site use including a machine shop and petroleum storage.

7.1.5 931 Washington Street Current Auto Repair and Former Filling Station (Off-Site)

The property located at 931 Washington Street was formerly the location of a gasoline station as depicted in the 1966 Sanborn map. An associated 3,000-gallon gasoline UST, which was installed in March 1947, has been removed from the property according to the MassDEP UST Query database. No information was available regarding the condition of the tank or analytical testing of the surrounding environmental media. The property has also been permitted as a Conditionally Exempt Small Quantity Generator (CESQG) since 1986 and is currently used for automotive repair. Manifests have been used to transport ignitable hazardous waste, such as petroleum distillates, from the property since this time. These chemicals have the potential to contaminate environmental media when not handled or disposed of properly. The property is located approximately 50 feet east of the Site. The former use of the property as a gasoline station and current use for automotive repair in close proximity to the Site are deemed a REC.

7.1.6 24-46 Morton Street Off-Site Chemical Company

Alpha Chemical Company located at 24-46 Morton Street abuts the Site to the west. The company has been listed as a RCRA CESQG since 2004, and wastes transported from the property under manifest include lead, 1,1,1-trichloroethane, hydrofluoric acid, and dimethyl-benzene. The company manufactures acid sanitizer, disinfectants, mildew preventatives, and liquid chlorinating products. Large aboveground tanks were noted against the western exterior of the company's building during the Site reconnaissance. In addition, a 1,000-gallon fuel oil tank was removed from the property in 1993 and there was no information provided by the Fire Department regarding analytical testing or environmental observations. Chemicals and petroleum stored at the property have the potential to have been released to the environment due to improper handling, disposal, or maintenance of containment structures. The storage of chemicals and petroleum at the property are therefore deemed a REC.

7.1.7 945 Washington Street Active Drycleaning Business (Off-Site)

Pearl Drycleaners of 945 Washington Street is listed with the MassDEP as a regulated drycleaning facility. This status indicates that the business utilizes perchloroethylene (PCE), a chemical solvent. When not properly disposed, PCE can contaminate soil and is highly mobile in groundwater. The property is located less than 100 feet southeast of the Site. The chemical handling practices of the drycleaning business are unknown and there is currently no publically available testing data for soil or groundwater between the Site and property. Therefore, the use of chemical solvents at the property is a deemed a REC.

7.1.8 45 Wyman Street Former Petroleum Storage at Stoughton Train Station (Off-Site)

The historic Stoughton train station constructed in 1888 and located at 45 Wyman Street was formerly heated using three 330-gallon above ground storage tanks located in the building's basement. According to the Stoughton Fire Department, the tanks were removed in 1997; however, no information was provided regarding the condition of the tanks or the surrounding basement floor. There is a potential for petroleum to have been released to the surrounding environment during fuel deliveries, or if the tanks and piping were improperly maintained. The station is located less than 50 feet northeast of the Site. Therefore, the former petroleum storage in close proximity to the Site is deemed a REC.

7.1.9 825 Washington Street Nearby Disposal Sites and Former Filling Station (RTNs 4-12937, 4-11868, 4-13560, and 4-13682)

Four releases have been identified at the former gasoline station located at 825 Washington Street. The primary contaminants are petroleum constituents, which are currently undergoing remediation. A definite groundwater flow direction has not been established at this property, which is located approximately 150 feet east of the Site. In addition, only one monitoring well exists between the disposal site and Site, which has been frequently dry and therefore may have not been installed at a sufficient depth to detect contamination. Due to this lack of information and the presence of a plume of petroleum constituents in groundwater, the disposal sites at this property are deemed a REC.

7.2 Potential Environmental Concerns

Three potential environmental concerns or *de minimis* conditions have been identified for the Site.

1) Based on the age of buildings, which may be demolished for the South Coast Rail project, asbestos containing materials, including roof flashing, tiles, and other materials, as well as lead based paint, may be present.
2) Due to the Site's densely developed location, close proximity to a railroad right-of-way and a long history of industrial and commercial use, urban fill may have been used to fill portions of the Site. Urban fill can contain metals and PAHs originating from coal/wood ash, tar, and/or slag.
3) Due to the close proximity of the railroad tracks and a suspected implementation of a vegetation control program in the vicinity of the railroad tracks, there is a possibility that lead, arsenic and other contaminants are present in Site soil.

8

Opinion

According to the Phase I ESA Standard, the report shall include an opinion of the impact on the Site of the conditions identified in the Findings Section. VHB's opinion is limited by the conditions prevailing at the time the work was performed and the applicable regulatory requirements in effect. VHB has ranked the potential for each REC to adversely impact the Site as Low, Moderate or High or deemed lesser issues as potential environmental concerns or *de minimis* conditions in accordance with the Standard. The Phase I Opinion for the RECs are as follows and is summarized in Table 8-1:

- **REC #1 –** The presence of three disposal sites and former industrial activities at 2 Canton Street represent a **High** potential to adversely impact the Site. Petroleum contamination has been identified at the property (a portion of the Site), and has not been remediated to background levels. An AUL is necessary at the property to maintain a Condition of No Significant Risk. Also, the extent to which former industrial activities may have impacted environmental media at the Site may not have been fully explored during previous investigations. Based on the size of the property, there may be areas that require additional assessment for the presence of OHM.
- **REC #2 –** The industrial uses of the Murphy Coal Company (parcel 054-406), and associated disposal site represents a **Moderate** potential to adversely impact the Site. A release of oil has occurred at this property (a portion of the Site); however, contamination has been remediated to background levels. In addition, large quantities of petroleum continue to be stored at the property, which is also used for automotive repair, and storage of fill materials. The extent to which these industrial uses may have impacted environmental media at the Site is unknown.
- **REC #3 –** The industrial activities and disposal site located at 25 Brock Street represent a **Moderate** potential to adversely impact the Site. A release of petroleum has occurred at the property (a portion of the Site); however, contamination was remediated to background concentrations. Additional petroleum storage has been recorded at the property, and the condition of the tanks or environmental media in the former tank locations has not been documented. In addition, the extent to which industrial activities may have impacted environmental media at the Site is unknown.

- **REC #4 –** The use of 48 Wyman Street as a machine shop represents a **Moderate** potential to adversely impact the Site. Former repair operations at the property may have required the use of oil and/or hazardous materials including petroleum products, solvents, and other chemicals. These chemicals have the potential to contaminate environmental media when not handled or disposed of properly. The extent to which the use of the property as a machine shop may have impacted environmental media is unknown.
- **REC #5 –** The presence of a former filling station and current automotive repair at 931 Washington Street represents a **Moderate** potential to adversely impact the Site. The condition of the property following the removal of a UST from the property is unknown. In addition, repair operations at the property may require the use of oil and/or hazardous materials including petroleum products, solvents, and other chemicals. The property is located in close proximity to the Site and contamination (if present) has the potential to migrate via groundwater to the Site.
- **REC #6 –** The presence of a chemical company abutting the Site represents a **Moderate** potential to adversely impact the Site. The chemical handling and storage practices at Alpha Chemical Company are unknown. In addition, fuel tank was removed from the property and the state of environmental media in the location of the tank is unknown. The property is located in close proximity to the Site and contamination (if present) has the potential to migrate via groundwater to the Site.
- **REC #7 –** The presence of a drycleaning business located adjacent to the Site represents a **Low** potential to adversely impact the Site. The business is an active user of PCE according to the MassDEP database, and the chemical handling practices of the business are unknown. The property is located in close proximity to the Site and contamination (if present) has the potential to migrate via groundwater to the Site.
- **REC #8 –** The former petroleum storage at 45 Wyman Street represents a **Low** potential to adversely impact the Site. Three ASTs were removed from the basement of the property in 1997; however no information was provided regarding the condition of the tanks or surrounding basement floor. The property is located in close proximity to the Site and contamination (if present) has the potential to migrate via groundwater to the Site.
- **REC #9 –** The presence of a former filling station at 825 Washington Street with four associated reported releases represents a **Moderate** potential to adversely impact the Site. A plume of petroleum constituents is actively undergoing remediation at the property, which is located in close proximity to the Site. In addition, sufficient data was not provided to demonstrate that groundwater located between the source area and the Site is not impacted.

Potential Environmental Concerns:

1) The potential presence of building materials containing asbestos, lead based paint or other hazardous materials is considered to have a low potential to adversely impact environmental media at the Site. According to 310 CMR

40.0317(12), releases from building materials that are in good repair and still serving their original intended use are not required to be reported under the MCP. However; hazardous building materials must still be properly managed during demolition.

2) Urban fill is considered to have a low potential to adversely impact the Site. Certain releases related to the presence of coal, coal ash, or wood ash are not required to be reported under the MCP in accordance with 310 CMR 40.0317(9). However, soil containing urban fill must still be properly managed during construction.

3) Pesticides applied in association with a vegetation control program are considered to have a low potential to adversely impact environmental media at the Site. According to 310 CMR 40.0317(8)(c), releases resulting from the application of pesticides in a manner consistent with their labeling is exempt from reporting under the MCP. However; soil containing concentrations of pesticides above applicable regulatory thresholds must still be properly managed during construction.

Table 8-1 Summary of Phase I Opinion

Address	Site Description	Phase I Opinion	Rationale
2 Canton Street	Former Use of the Property and On-Site Disposal Site	High	Petroleum contamination has not been remediated to background levels Extent of impact due to former site activities is unknown
Off 17 Morton Square	Murphy Coal Company On-Site Automotive Repair, Petroleum Storage, and Disposal Site	Moderate	Extent of impact due to former site activities is unknown
25 Brock Street	Industrial Use of the Property and On-Site Disposal Site	Moderate	Extent of impact due to former site activities and petroleum storage is unknown
48 Wyman Street	Use of the Property as a Machine Shop	Moderate	Extent of impact due to former site activities is unknown
931 Washington Street	Current Auto Repair and Former Filling Station	Moderate	Extent of impact due to former site activities is unknown Proximity to the Site
24-46 Morton Street	Off-Site Chemical Company	Moderate	Extent of impact due to former site activities is unknown
945 Washington Street	Active Drycleaning Business	Low	Chemical handling practices are unknown
45 Wyman Street	Former Petroleum Storage at Stoughton Train Station	Low	Information regarding removal of ATS is unavailable
825 Washington Street	Nearby Disposal Sites and Former Filling Station	Moderate	Insufficient data on plume of petroleum constituents

Signature and Qualifications of Environmental Professional

I declare that, to the best of my professional knowledge and belief, I meet the definition of Environmental Professional as defined in §312.10 of 40 CFR 312. I have the specific qualifications based on education, training, and experience to assess a property of the nature, history, and setting of the subject property. I have developed and performed the all appropriate inquiries in conformance with the standards and practices set forth in 40 CFR Part 312.

Environmental Professional: _____ 7/17/2012

Appendix A Limitations

This page intentionally left blank.

Limitations

The following limitations exist:

- This report has been prepared for the sole and exclusive use of the Client. It is subject to and issued in connection with the Agreement and the provisions thereof. Any use or reliance upon information provided in this report, without the specific written authorization of the Client and VHB, shall be at the User's sole risk.
- In conducting this assessment, VHB has obtained and relied upon information from multiple sources to form certain conclusions regarding potential environmental issues at and in the vicinity of the subject property. Except as otherwise noted, no attempt has been made to verify the accuracy or completeness of such information.
- The objectives of the assessment described in this report were to assess the physical characteristics of the subject property with respect to overt evidence of past or present use, storage, and/or disposal of oil or hazardous materials, as defined in applicable state and federal environmental laws and regulations, and to gather information regarding current and past operations and environmental conditions at and in the vicinity of the subject property.
- Where access was denied or conditions obscured, VHB makes no report on such areas.
- No attempt has been made to assess the compliance status of any past or present Owner or Operator of the Site with any federal, state, or local laws or regulations.
- The findings, observations, and conclusions presented in this report are limited by the scope of services outlined in our Agreement, which reflects schedule and budgetary constraints imposed, by the Client for the current phase of environmental assessment. Furthermore, the assessment has been performed in accordance with generally accepted engineering practices and standards set forth in ASTM E 1527-05. No other warranty, expressed or implied, is made.
- The assessment presented in this report is based solely upon information gathered to date. Should further environmental or other relevant information be developed at a later date, the Client should bring the information to the attention of VHB as soon as possible. Based upon an evaluation, VHB may modify the report and its conclusions.
- The EDR Environmental Data Resources Inc. (EDR) Radius Map with GeoCheck was conducted under the Notice of Disclaimer/Waiver of Liability included in the summary report.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-05) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

TARGET PROPERTY INFORMATION

ADDRESS

WYMAN STREET/BROCK STREET
STOUGHTON, MA 02072

COORDINATES

Latitude (North):	42.1221000 - 42° 7' 19.56''
Longitude (West):	71.1024000 - 71° 6' 8.64''
Universal Tranverse Mercator:	Zone 19
UTM X (Meters):	326208.7
UTM Y (Meters):	4665258.5
Elevation:	227 ft. above sea level

TARGET PROPERTY SEARCH RESULTS

The target property was not listed in any of the databases searched by EDR.

EXECUTIVE SUMMARY

DATABASES WITH NO MAPPED SITES

No mapped sites were found in EDR's search of available ("reasonably ascertainable ") government records either on the target property or within the search radius around the target property for the following databases:

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL ---------- National Priority List
Proposed NPL ---------- Proposed National Priority List Sites
NPL LIENS ---------- Federal Superfund Liens

Federal Delisted NPL site list

Delisted NPL ---------- National Priority List Deletions

Federal CERCLIS list

CERCLIS ---------- Comprehensive Environmental Response, Compensation, and Liability Information System
FEDERAL FACILITY ---------- Federal Facility Site Information listing

Federal CERCLIS NFRAP site List

CERC-NFRAP ---------- CERCLIS No Further Remedial Action Planned

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF ---------- RCRA - Treatment, Storage and Disposal

Federal RCRA generators list

RCRA-LQG ---------- RCRA - Large Quantity Generators
RCRA-SQG ---------- RCRA - Small Quantity Generators

Federal institutional controls / engineering controls registries

US ENG CONTROLS ---------- Engineering Controls Sites List
US INST CONTROL ---------- Sites with Institutional Controls

Federal ERNS list

ERNS ---------- Emergency Response Notification System

State and tribal landfill and/or solid waste disposal site lists

SWF/LF ---------- Solid Waste Facility Database/Transfer Stations

State and tribal leaking storage tank lists

INDIAN LUST ---------- Leaking Underground Storage Tanks on Indian Land

State and tribal registered storage tank lists

INDIAN UST ---------- Underground Storage Tanks on Indian Land

FEMA UST ---------- Underground Storage Tank Listing

State and tribal voluntary cleanup sites

INDIAN VCP ---------- Voluntary Cleanup Priority Listing

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS ---------- A Listing of Brownfields Sites

Local Lists of Landfill / Solid Waste Disposal Sites

ODI ---------- Open Dump Inventory
DEBRIS REGION 9 ---------- Torres Martinez Reservation Illegal Dump Site Locations
INDIAN ODI ---------- Report on the Status of Open Dumps on Indian Lands

Local Lists of Hazardous waste / Contaminated Sites

US CDL ---------- Clandestine Drug Labs
US HIST CDL ---------- National Clandestine Laboratory Register

Local Land Records

LIENS 2 ---------- CERCLA Lien Information
LUCIS ---------- Land Use Control Information System
LIENS ---------- Liens Information Listing

Records of Emergency Release Reports

HMIRS ---------- Hazardous Materials Information Reporting System
SPILLS ---------- Historical Spill List

Other Ascertainable Records

DOT OPS ---------- Incident and Accident Data
DOD ---------- Department of Defense Sites
FUDS ---------- Formerly Used Defense Sites
CONSENT ---------- Superfund (CERCLA) Consent Decrees
ROD ---------- Records Of Decision
UMTRA ---------- Uranium Mill Tailings Sites
TRIS ---------- Toxic Chemical Release Inventory System
TSCA ---------- Toxic Substances Control Act
FTTS ---------- FIFRA/ TSCA Tracking System - FIFRA (Federal Insecticide, Fungicide, & Rodenticide Act)/TSCA (Toxic Substances Control Act)
HIST FTTS ---------- FIFRA/TSCA Tracking System Administrative Case Listing
SSTS ---------- Section 7 Tracking Systems
ICIS ---------- Integrated Compliance Information System
PADS ---------- PCB Activity Database System
MLTS ---------- Material Licensing Tracking System
RADINFO ---------- Radiation Information Database
FINDS ---------- Facility Index System/Facility Registry System
RAATS ---------- RCRA Administrative Action Tracking System

NPDES NPDES Permit Listing
ENF Enforcement Action Cases
AIRS Permitted Facilities Listing
LEAD Lead Inspection Database
INDIAN RESERV Indian Reservations
SCRD DRYCLEANERS State Coalition for Remediation of Drycleaners Listing
FINANCIAL ASSURANCE Financial Assurance Information Listing
GWDP Ground Water Discharge Permits
COAL ASH DOE Sleam-Electric Plan Operation Data
COAL ASH EPA Coal Combustion Residues Surface Impoundments List
PCB TRANSFORMER PCB Transformer Registration Database

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

Federal RCRA CORRACTS facilities list

CORRACTS: CORRACTS is a list of handlers with RCRA Corrective Action Activity. This report shows which nationally-defined corrective action core events have occurred for every handler that has had corrective action activity.

A review of the CORRACTS list, as provided by EDR, and dated 08/19/2011 has revealed that there is 1 CORRACTS site within approximately 1 mile of the target property.

JET LINE SERVICES INC	***441R CANTON STREET***	***WNW 1/2 - 1 (0.806 mi.)***	***S76***	***436***

Federal RCRA generators list

RCRA-CESQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

A review of the RCRA-CESQG list, as provided by EDR, and dated 11/10/2011 has revealed that there are

5 RCRA-CESQG sites within approximately 0.25 miles of the target property.

Other Ascertainable Records

RCRA-NonGen: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA-NonGen list, as provided by EDR, and dated 11/10/2011 has revealed that there are 9 RCRA-NonGen sites within approximately 0.25 miles of the target property.

EDR PROPRIETARY RECORDS

EDR Proprietary Records

Manufactured Gas Plants: The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

A review of the Manufactured Gas Plants list, as provided by EDR, has revealed that there is 1 Manufactured Gas Plants site within approximately 1 mile of the target property.

Classification: Not a generator, verified

Hazardous Waste Summary:
Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Environmental Interest/Information System

AFS (Aerometric Information Retrieval System (AIRS) Facility Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aerometric Data (SAROAD). AIRS is the national repository for information concerning airborne pollution in the United States. AFS is used to track emissions and compliance data from industrial plants. AFS data are utilized by states to prepare State Implementation Plans to comply with regulatory programs and by EPA as an input for the estimation of total national emissions. AFS is undergoing a major redesign to support facility operating permits required under Title V of the Clean Air Act.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Hazardous Waste Summary:
Waste code: D002
Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

Waste code: D008
Waste name: LEAD

Waste code: U134
Waste name: HYDROFLUORIC ACID (C,T)

Waste code: U226
Waste name: ETHANE, 1,1,1-TRICHLORO-

Waste code: U239
Waste name: BENZENE, DIMETHYL- (I,T)

Environmental Interest/Information System

US EPA TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are transported off-site.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

MA-EPICS - Massachussetts Environmental Protection Integrated Computer System

ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and it Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include; Incident Tracking, Compliance Assistance, and Compliance Monitoring.

SSTS (Section Seven Tracking System) evolved from the FIFRA and TSCA Enforcement System (FATES). SSTS tracks the registration of all pesticide-producing establishments and tracks annually the types and amounts of pesticides, active ingredients, and related devices that are produced, sold, or distributed each year.

Hazardous Waste Summary:
Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Violation Status: No violations found

Registry ID: 110003435408

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Hazardous Waste Summary:

Waste code:	D001
Waste name:	IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport,

STOUGHTON DYE HOUSE INC (Continued) **1000424925**

and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Hazardous Waste Summary:
Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Waste code: D002
Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS

DEQE OFFICE OF RESPONSE (Continued) **1000197802**

CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

Waste code: F001
Waste name: THE FOLLOWING SPENT HALOGENATED SOLVENTS USED IN DEGREASING: TETRACHLOROETHYLENE, TRICHLOROETHYLENE, METHYLENE CHLORIDE, 1,1,1-TRICHLOROETHANE, CARBON TETRACHLORIDE, AND CHLORINATED FLUOROCARBONS; ALL SPENT SOLVENT MIXTURES/BLENDS USED IN DEGREASING CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE HALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F002, F004, AND F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Waste code: F002
Waste name: THE FOLLOWING SPENT HALOGENATED SOLVENTS: TETRACHLOROETHYLENE, METHYLENE CHLORIDE, TRICHLOROETHYLENE, 1,1,1-TRICHLOROETHANE, CHLOROBENZENE, 1,1,2-TRICHLORO-1,2,2-TRIFLUOROETHANE, ORTHO-DICHLOROBENZENE, TRICHLOROFLUOROMETHANE, AND 1,1,2-TRICHLOROETHANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE HALOGENATED SOLVENTS OR THOSE LISTED IN F001, F004, OR F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Waste code: F003
Waste name: THE FOLLOWING SPENT NON-HALOGENATED SOLVENTS: XYLENE, ACETONE, ETHYL ACETATE, ETHYL BENZENE, ETHYL ETHER, METHYL ISOBUTYL KETONE, N-BUTYL ALCOHOL, CYCLOHEXANONE, AND METHANOL; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONLY THE ABOVE SPENT NON-HALOGENATED SOLVENTS; AND ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONE OR MORE OF THE ABOVE NON-HALOGENATED SOLVENTS, AND, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THOSE SOLVENTS LISTED IN F001, F002, F004, AND F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Waste code: F005
Waste name: THE FOLLOWING SPENT NON-HALOGENATED SOLVENTS: TOLUENE, METHYL ETHYL KETONE, CARBON DISULFIDE, ISOBUTANOL, PYRIDINE, BENZENE, 2-ETHOXYETHANOL, AND 2-NITROPROPANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE NON-HALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F001, F002, OR F004; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Used oil transporter: No

Hazardous Waste Summary:
Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Waste code: D011
Waste name: SILVER

Violation Status: No violations found

Evaluation Action Summary:
Evaluation date: 02/01/1991
Evaluation: COMPLIANCE EVALUATION INSPECTION ON-SITE
Area of violation: Not reported
Date achieved compliance: Not reported
Evaluation lead agency: State

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Hazardous Waste Summary:
Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Violation Status: No violations found

Handler Activities Summary:
U.S. importer of hazardous waste: No
Mixed waste (haz. and radioactive): No
Recycler of hazardous waste: No
Transporter of hazardous waste: No
Treater, storer or disposer of HW: No
Underground injection activity: No
On-site burner exemption: No
Furnace exemption: No
Used oil fuel burner: No
Used oil processor: No
User oil refiner: No
Used oil fuel marketer to burner: No
Used oil Specification marketer: No
Used oil transfer facility: No
Used oil transporter: No

Hazardous Waste Summary:
Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Waste code: F003
Waste name: THE FOLLOWING SPENT NON-HALOGENATED SOLVENTS: XYLENE, ACETONE, ETHYL ACETATE, ETHYL BENZENE, ETHYL ETHER, METHYL ISOBUTYL KETONE, N-BUTYL ALCOHOL, CYCLOHEXANONE, AND METHANOL; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONLY THE ABOVE SPENT NON-HALOGENATED SOLVENTS; AND ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONE OR MORE OF THE ABOVE NON-HALOGENATED SOLVENTS, AND, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THOSE SOLVENTS LISTED IN F001, F002, F004, AND F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT

STOUGHTON AUTO BODY INC (Continued) **1000424926**

MIXTURES.

Waste code: F005
Waste name: THE FOLLOWING SPENT NON-HALOGENATED SOLVENTS: TOLUENE, METHYL ETHYL KETONE, CARBON DISULFIDE, ISOBUTANOL, PYRIDINE, BENZENE, 2-ETHOXYETHANOL, AND 2-NITROPROPANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE NON-HALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F001, F002, OR F004; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Violation Status: No violations found

Environmental Interest/Information System
AFS (Aerometric Information Retrieval System (AIRS) Facility Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aerometric Data (SAROAD). AIRS is the national repository for

BROOKFIELD ENGINEERING LAB INC (Continued) **1000333073**

information concerning airborne pollution in the United States. AFS is used to track emissions and compliance data from industrial plants. AFS data are utilized by states to prepare State Implementation Plans to comply with regulatory programs and by EPA as an input for the estimation of total national emissions. AFS is undergoing a major redesign to support facility operating permits required under Title V of the Clean Air Act.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Response Action Outcome: A permanent solution has been achieved. Contamination has not been reduced to background.

Action Type: RLFA
Action Stat: FLDRAN
Action Date: 11/8/2005
Response Action Outcome: A permanent solution has been achieved. Contamination has not been reduced to background.

Action Type: A Notice sent to a Potentially Responsible Party (PRP)
Action Stat: A MassDEP piece of correspondence was issued (approvals, NORs, etc.
Action Date: 11/22/2005
Response Action Outcome: A permanent solution has been achieved. Contamination has not been reduced to background.

Action Type: Immediate Response Action

JET LINE SERVICES INC (Continued) **S106508911**

Action Stat: Written Plan Received
Action Date: 1/6/2006
Response Action Outcome: A permanent solution has been achieved. Contamination has not been reduced to background.

Action Type: Response Action Outcome - RAO
Action Stat: RAO Statement Received
Action Date: 11/3/2006
Response Action Outcome: A permanent solution has been achieved. Contamination has not been reduced to background.

Action Type: RNF
Action Stat: Reportable Release under MGL 21E
Action Date: 1/6/2006
Response Action Outcome: A permanent solution has been achieved. Contamination has not been reduced to background.

Action Type: Immediate Response Action
Action Stat: Status or Interim Report Received
Action Date: 10/12/2006
Response Action Outcome: A permanent solution has been achieved. Contamination has not been reduced to background.

Action Type: Response Action Outcome - RAO
Action Stat: Level I - Technical Screen Audit
Action Date: 10/9/2008
Response Action Outcome: A permanent solution has been achieved. Contamination has not been reduced to background.

Action Type: Response Action Outcome - RAO
Action Stat: Fee Received - FMCRA Use Only
Action Date: 11/7/2006
Response Action Outcome: A permanent solution has been achieved. Contamination has not been reduced to background.

Hazardous Waste Summary:
Waste code: K049
Waste name: SLOP OIL EMULSION SOLIDS FROM THE PETROLEUM REFINING INDUSTRY

Waste code: K051
Waste name: API SEPARATOR SLUDGE FROM THE PETROLEUM REFINING INDUSTRY

JET LINE SERVICES INC (Continued) **1000122251**

Waste code: K052
Waste name: TANK BOTTOMS (LEADED) FROM THE PETROLEUM REFINING INDUSTRY

Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Waste code: D002
Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

Waste code: D008
Waste name: LEAD

Waste code: D011
Waste name: SILVER

Waste code: D018
Waste name: BENZENE

Biennial Reports:

Last Biennial Reporting Year: 2011

Annual Waste Handled:
Waste code: D001

Corrective Action Summary:

JET LINE SERVICES INC (Continued) **1000122251**

Event date: 09/30/1991
Event: RFI Imposition

Event date: 06/22/1992
Event: RFA Completed, Assessment was a PA-Plus.

Event date: 04/06/1993
Event: CA Prioritization, Facility or area was assigned a medium corrective action priority.

Event date: 09/10/2002
Event: Current Human Exposures under Control, Yes, Current Human Exposures Under Control has been verified. Based on a review of information contained in the EI determination, current human exposures are expected to be under control at the facility under current and reasonably expected conditions. This determination will be re-evaluated when the Agency/State becomes aware of significant changes at the facility.

Event date: 09/10/2002
Event: Igration of Contaminated Groundwater under Control, Yes, Migration of Contaminated Groundwater Under Control has been verified. Based on a review of information contained in the EI determination, it has been determined that migration of contaminated groundwater is under control at the facility. Specifically, this determination indicates that the migration of contaminated groundwater is under control, and that monitoring will be conducted to confirm that contaminated groundwater remains within the existing area of contaminated groundwater. This determination will be re-evaluated when the Agency becomes aware of significant changes at the facility.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Date of Government Version: 09/07/2011

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

Date of Government Version: 09/07/2011

Data Release Frequency: Quarterly

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

Federal Delisted NPL site list

DELISTED NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Date of Government Version: 09/07/2011

Federal CERCLIS list

CERCLIS: Comprehensive Environmental Response, Compensation, and Liability Information System

CERCLIS contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). CERCLIS contains sites which are either proposed to or on the National Priorities List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL.

Federal CERCLIS NFRAP site List

CERCLIS-NFRAP: CERCLIS No Further Remedial Action Planned

Archived sites are sites that have been removed and archived from the inventory of CERCLIS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list this site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. This decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be a potential NPL site.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Federal RCRA generators list

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

Date of Government Version: 11/10/2011

RCRA-SQG: RCRA - Small Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

Date of Government Version: 11/10/2011

RCRA-CESQG: RCRA - Conditionally Exempt Small Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites
Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

Other Ascertainable Records

RCRA-NonGen: RCRA - Non Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing

A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

Date of Government Version: 10/19/2006

SSTS: Section 7 Tracking Systems

Section 7 of the Federal Insecticide, Fungicide and Rodenticide Act, as amended (92 Stat. 829) requires all registered pesticide-producing establishments to submit a report to the Environmental Protection Agency by March 1st each year. Each establishment must report the types and amounts of pesticides, active ingredients and devices being produced, and those having been produced and sold or distributed in the past year.

Data Release Frequency: Quarterly

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

EDR PROPRIETARY RECORDS

EDR Proprietary Records

Manufactured Gas Plants: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data

Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Date of Government Version: 02/20/2012

Oil/Gas Pipelines: This data was obtained by EDR from the USGS in 1994. It is referred to by USGS as GeoData Digital Line Graphs from 1:100,000-Scale Maps. It was extracted from the transportation category including some oil, but primarily gas pipelines.

Electric Power Transmission Line Data
Source: Rextag Strategies Corp.
Telephone: (281) 769-2247
U.S. Electric Transmission and Power Plants Systems Digital GIS Data

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:
Source: American Hospital Association, Inc.
Telephone: 312-280-5991
The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing
Source: Centers for Medicare & Medicaid Services
Telephone: 410-786-3000
A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

Nursing Homes
Source: National Institutes of Health
Telephone: 301-594-6248
Information on Medicare and Medicaid certified nursing homes in the United States.

Public Schools
Source: National Center for Education Statistics
Telephone: 202-502-7300
The National Center for Education Statistics' primary database on elementary and secondary public education in the United States. It is a comprehensive, annual, national statistical database of all public elementary and secondary schools and school districts, which contains data that are comparable across all states.

Private Schools
Source: National Center for Education Statistics
Telephone: 202-502-7300
The National Center for Education Statistics' primary database on private school locations in the United States.

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 2003 & 2011 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002 and 2005 from the U.S. Fish and Wildlife Service.

Areas of Critical Environmental Concern Datalayer: The Areas of Critical Environmental Concern (ACEC) datalayer shows the location of areas that have been designated ACECs by the Secretary of Environmental Affairs. ACEC designation requires greater environmental review of certain kinds of proposed development under state jurisdiction within the ACEC boundaries. The ACEC Program is administered by the Department of Environmental Management (DEM) on behalf of the Secretary of Environmental Affairs. The Massachusetts Coastal Zone Management (MCZM) Office managed the original Coastal ACEC Program from 1978 to 1993, and continues to play a key role in monitoring coastal ACECs. Procedures for ACEC designation and the general policies governing the effects of designation are contained in the ACEC regulations (301 CMR 12.00). The ACEC datalayer has been compiled by MCZM and DEM and includes both coastal and inland areas.

Scanned Digital USGS 7.5' Topographic Map (DRG)
Source: United States Geologic Survey
A digital raster graphic (DRG) is a scanned image of a U.S. Geological Survey topographic map. The map images are made by scanning published paper maps on high-resolution scanners. The raster image is georeferenced and fit to the Universal Transverse Mercator (UTM) projection.

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principal investigative components:

1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).

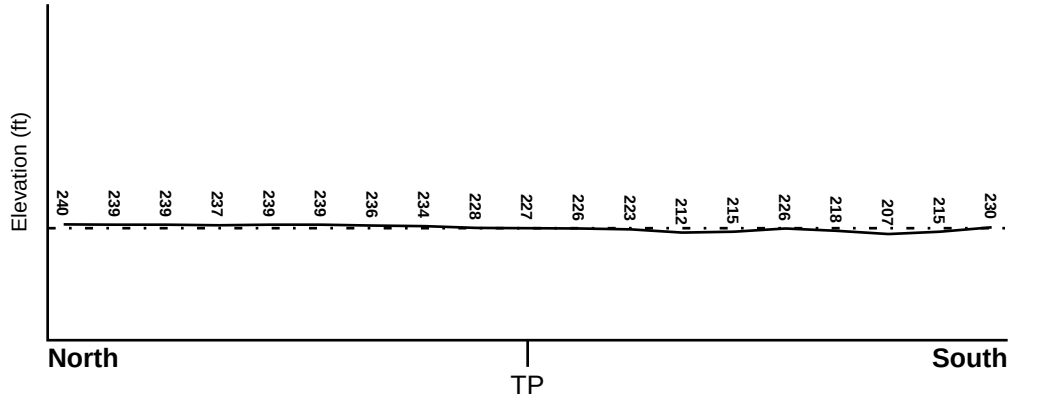
TOPOGRAPHIC INFORMATION

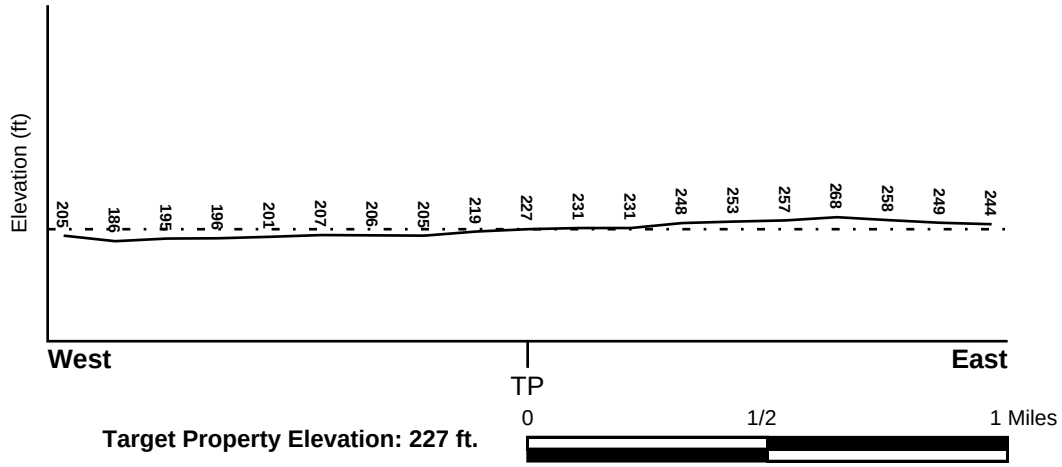
Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General WSW

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES





0 1/2 1 Miles

Target Property Elevation: 227 ft.

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Target Property County	FEMA Flood Electronic Data
NORFOLK, MA	YES - refer to the Overview Map and Detail Map

Flood Plain Panel at Target Property: 2502530001B - FEMA Q3 Flood data

Additional Panels in search area: 2502530004B - FEMA Q3 Flood data

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
BROCKTON	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW
2	1/8 - 1/4 Mile NNW	SW
8	1/2 - 1 Mile ESE	VARIES
C13	1/2 - 1 Mile North	NNW

For additional site information, refer to Physical Setting Source Map Findings.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

ROCK STRATIGRAPHIC UNIT

Era:	Precambrian

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. The following information is based on Soil Conservation Service SSURGO data.

Soil Map ID: 1

Soil Component Name:	Urban land
Soil Surface Texture:	
Hydrologic Group:	Not reported
Soil Drainage Class:	
Hydric Status: Unknown	
Corrosion Potential - Uncoated Steel:	Not Reported
Depth to Bedrock Min:	> 0 inches
Depth to Watertable Min:	> 0 inches

No Layer Information available.

Soil Map ID: 2

Soil Component Name:	Walpole
Soil Surface Texture:	sandy loam
Hydrologic Group:	Class C - Slow infiltration rates. Soils with layers impeding downward movement of water, or soils with moderately fine or fine textures.
Soil Drainage Class:	Poorly drained
Hydric Status: Partially hydric	
Corrosion Potential - Uncoated Steel:	Low
Depth to Bedrock Min:	> 0 inches
Depth to Watertable Min:	> 15 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	9 inches	sandy loam	Not reported	Not reported	Max: 141.14 Min: 42.34	Max: 7.3 Min: 4.5
2	9 inches	12 inches	sandy loam	Not reported	Not reported	Max: 141.14 Min: 42.34	Max: 7.3 Min: 4.5
3	12 inches	59 inches	stratified coarse sand to loamy fine sand	Not reported	Not reported	Max: 141.14 Min: 42.34	Max: 7.3 Min: 4.5

Soil Map ID: 3

Soil Component Name: Merrimac

Soil Surface Texture: fine sandy loam

Hydrologic Group: Class A - High infiltration rates. Soils are deep, well drained to excessively drained sands and gravels.

Soil Drainage Class: Somewhat excessively drained

Hydric Status: Unknown

Corrosion Potential - Uncoated Steel: Low

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	18 inches	fine sandy loam	Not reported	Not reported	Max: 141.14 Min: 42.34	Max: 6 Min: 3.6
2	18 inches	22 inches	gravelly loamy sand	Not reported	Not reported	Max: 141.14 Min: 42.34	Max: 6 Min: 3.6
3	22 inches	59 inches	sr to sand to very gravelly coarse sand	Not reported	Not reported	Max: 141.14 Min: 42.34	Max: 6 Min: 3.6

Soil Map ID: 4

Soil Component Name: Freetown

Soil Surface Texture: muck

Hydrologic Group: Class D - Very slow infiltration rates. Soils are clayey, have a high water table, or are shallow to an impervious layer.

Soil Drainage Class: Very poorly drained

Hydric Status: All hydric

Corrosion Potential - Uncoated Steel: High

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 15 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	14 inches	muck	Not reported	Not reported	Max: 42.34 Min: 4.23	Max: Min:
2	14 inches	59 inches	muck	Not reported	Not reported	Max: 42.34 Min: 4.23	Max: Min:

Soil Map ID: 5

Soil Component Name: Udorthents

Soil Surface Texture: muck

Hydrologic Group: Class D - Very slow infiltration rates. Soils are clayey, have a high water table, or are shallow to an impervious layer.

Soil Drainage Class:
Hydric Status: Partially hydric

Corrosion Potential - Uncoated Steel: Not Reported

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

No Layer Information available.

Soil Map ID: 6

Soil Component Name: Freetown

Soil Surface Texture: muck

Hydrologic Group: Class D - Very slow infiltration rates. Soils are clayey, have a high water table, or are shallow to an impervious layer.

Soil Drainage Class: Very poorly drained

Hydric Status: All hydric

Corrosion Potential - Uncoated Steel: High

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	59 inches	muck	Not reported	Not reported	Max: 42.34 Min: 4.23	Max: Min:

Soil Map ID: 7

Soil Component Name: Canton

Soil Surface Texture: fine sandy loam

Hydrologic Group: Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.

Soil Drainage Class: Well drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Low

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	3 inches	fine sandy loam	Not reported	Not reported	Max: 141.14 Min: 42.34	Max: 6 Min: 3.6
2	3 inches	18 inches	fine sandy loam	Not reported	Not reported	Max: 141.14 Min: 42.34	Max: 6 Min: 3.6
3	18 inches	59 inches	gravelly loamy sand	Not reported	Not reported	Max: 141.14 Min: 42.34	Max: 6 Min: 3.6

Soil Map ID: 8

Soil Component Name: Udorthents

Soil Surface Texture: variable

Hydrologic Group: Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.

Soil Drainage Class:
Hydric Status: Partially hydric

Corrosion Potential - Uncoated Steel: Not Reported

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	5 inches	variable	Not reported	Not reported	Max: 141.14 Min: 0.42	Max: Min:
2	5 inches	59 inches	variable	Not reported	Not reported	Max: 141.14 Min: 0.42	Max: Min:

LOCAL / REGIONAL WATER AGENCY RECORDS

EDR Local/Regional Water Agency records provide water well information to assist the environmental professional in assessing sources that may impact ground water flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)
Source: United States Geologic Survey
EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Scanned Digital USGS 7.5' Topographic Map (DRG)
Source: United States Geologic Survey
A digital raster graphic (DRG) is a scanned image of a U.S. Geological Survey topographic map. The map images are made by scanning published paper maps on high-resolution scanners. The raster image is georeferenced and fit to the Universal Transverse Mercator (UTM) projection.

HYDROLOGIC INFORMATION

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 2003 & 2011 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002 and 2005 from the U.S. Fish and Wildlife Service.

HYDROGEOLOGIC INFORMATION

AQUIFLOW^{R} Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit
Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Services
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Services (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Services, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

LOCAL / REGIONAL WATER AGENCY RECORDS

FEDERAL WATER WELLS

PWS: Public Water Systems
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Public Water System data from the Federal Reporting Data System. A PWS is any water system which provides water to at least 25 people for at least 60 days annually. PWSs provide water from wells, rivers and other sources.

PWS ENF: Public Water Systems Violation and Enforcement Data
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Violation and Enforcement data for Public Water Systems from the Safe Drinking Water Information System (SDWIS) after August 1995. Prior to August 1995, the data came from the Federal Reporting Data System (FRDS).

USGS Water Wells: USGS National Water Inventory System (NWIS)
This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on wells, springs, and other sources of groundwater.

STATE RECORDS

Massachusetts Geographic Information System (MassGIS) Datalayers
Source: Executive Office of Environmental Affairs

Public Water Supply Database: The Public Water Supply datalayer contains the locations of public community surface and groundwater supply sources and public non-community supply sources as defined in 310 CMR 22.00.

OTHER STATE DATABASE INFORMATION

Areas of Critical Environmental Concern Datalayer: The Areas of Critical Environmental Concern (ACEC) datalayer shows the location of areas that have been designated ACECs by the Secretary of Environmental Affairs. ACEC designation requires greater environmental review of certain kinds of proposed development under state jurisdiction within the ACEC boundaries. The ACEC Program is administered by the Department of Environmental Management (DEM) on behalf of the Secretary of Environmental Affairs. The Massachusetts Coastal Zone Management (MCZM) Office managed the original Coastal ACEC Program from 1978 to 1993, and continues to play a key role in monitoring coastal ACECs. Procedures for ACEC designation and the general policies governing the effects of designation are contained in the ACEC regulations (301 CMR 12.00). The ACEC datalayer has been compiled by MCZM and DEM and includes both coastal and inland areas.

EPA Designated Sole Source Aquifers Datalayer: The Sole Source Aquifer datalayer was compiled by the Department of Environmental Protection (DEP) Division of Water Supply (DWS). Seven Sole Source Aquifers have been designated by the US Environmental Protection Agency (EPA) for Massachusetts. A Sole Source Aquifer (SSA) is an aquifer designated by US EPA as the sole or principal source of drinking water for a given aquifer service area; that is, an aquifer which is needed to supply 50% or more of the drinking water for that area and for which there are no reasonably available alternative sources should that aquifer become contaminated. The aquifers were defined by a EPA hydrogeologist.

Aquifers Datalayer: MassGIS produced an aquifer datalayer composed of 20 individual panels, generally based on the boundaries of the major drainage basins. Areas of high and medium yield were mapped. This datalayer includes polygon attribute coding to help in the identification of areas in which cleanup of hazardous waste sites must meet drinking water standards, as defined in the Massachusetts Contingency Plan (MCP) (310 CMR 40.00000).

Non-Potential Drinking Water Source Areas: Non-Potential Drinking Water Source Areas (NPDWSA) are regulatory in nature, representing one of many considerations used in determining the standards to which ground water must be cleaned in the event of a release of oil or hazardous material. NPDWSAs are not based on existing water quality and do not indicate poor ambient conditions.

DEP Approved Zone IIs Datalayer: The Department of Environmental Protection (DEP) approved Zone IIs datalayer was compiled by the DEP Division of Water Supply (DWS). The database contains 281 approved Zone IIs statewide. As stated in 310 CMR 22.02, a Zone II is "that area of an aquifer which contributes water to a well under the most severe pumping and recharge conditions that can be realistically anticipated (180 days of pumping at safe yield, with no recharge from precipitation.) It is bounded by the groundwater divides which result from pumping the well and by the contact of the aquifer with less permeable materials such as till or bedrock. In some cases, streams or lakes may act as recharge boundaries. In all cases, Zone IIs shall extend up gradient to its point of intersection with prevailing hydrogeologic boundaries (a groundwater flow divide, a contact with till or bedrock, or a recharge boundary)." These data are used in association with the Public Water Supplies datalayer. The following describes certain unique features of this association.

- Any proposed new well which will pump at least 100,000 gallons per day must have a Zone II delineation completed and approved by DEP prior to the well coming on line.
- Additionally, a new source may not be on-line yet, but other, older wells may fall within its Zone II boundary.
- Further, existing wells must have a Zone II delineated as a condition of receiving a water withdrawal permit under the Water Management Act.

RADON

State Database: MA Radon
Source: Department of Health
Telephone: 413-586-7525
Radon Test Results

Area Radon Information
Source: USGS
Telephone: 703-356-4020
The National Radon Database has been developed by the U.S. Environmental Protection Agency (USEPA) and is a compilation of the EPA/State Residential Radon Survey and the National Residential Radon Survey. The study covers the years 1986 - 1992. Where necessary data has been supplemented by information collected at private sources such as universities and research institutions.

EPA Radon Zones
Source: EPA
Telephone: 703-356-4020
Sections 307 & 309 of IRAA directed EPA to list and identify areas of U.S. with the potential for elevated indoor radon levels.

1. INTRODUCTION

Woodard & Curran Inc. (W&C) has prepared this Class A-3 Response Action Outcome (RAO) Statement for the Disposal Site identified by the Massachusetts Department of Environmental Protection (MassDEP) Release Tracking Number (RTN) 4-00875 (the Site). The Site is situated along a portion of the property located at 2 Canton Street in Stoughton, Massachusetts (the Property). This RAO Statement has been prepared on behalf of Stoughton Center Business Park, LLC (the current property owner) in accordance with the Massachusetts Contingency Plan (MCP; 310 CMR 40.0000; MassDEP 2007a). The Site generally consists of the courtyard area of the Property and portions of the Site buildings, which have been impacted by petroleum hydrocarbons and related constituents as a result of two leaking underground storage tanks (USTs) that formerly serviced the existing buildings at the Property. Response actions have been conducted at the Site since 1989 (when the release was discovered) and most recently included excavation of petroleum-impacted soil under a Release Abatement Measure (RAM) Plan submitted to the MassDEP in August 2008 (W&C, 2008a). During the course of investigation and remediation activities conducted under the RTN 4-00875, two additional reportable conditions were triggered resulting in the assignment of two new RTNs (4-18753 and 4-21470). These RTNs were later linked to the Site's primary RTN 4-00875, and therefore individual RAO Statements are not required. Figure 1 depicts the location of the Site (Site Locus). Figure 2 (Site Plan) provides an illustration of the Site that is the subject of this Class A-3 RAO Statement and how it relates to the property lines for the 2 Canton Street property.

This RAO Statement has been prepared in accordance with the MCP at 310 CMR 40.1036. In accordance with 310 CMR 40.1035, a Class A RAO is applicable to the Site because:

1) A Permanent Solution has been achieved; and
2) Response actions have been conducted to:
    a) Achieve a level of No Significant Risk (NSR);
    b) Eliminate or control sources of oil and/or hazardous materials (OHM); and
    c) Where feasible, reduce to the extent possible, the level of OHM concentrations in the environment to background.

Pursuant to 310 CMR 40.1036(2), a category Class A-3 RAO is applicable to the Site because:

1) A Permanent Solution has been achieved;
2) The level of OHM in the environmental has not been reduced to background;
3) One or more Activity and Use Limitations (AULs) is required to maintain a level of NSR; and
4) OHM at the disposal site do not exceed an applicable Upper Concentration Limit (UCL) in soil or groundwater.

The RAO Statement Transmittal Form (BWSC104) is being provided via electronic transmission with this report (refer to Appendix A). A copy of the recorded Notice of AUL supporting the Class A-3 RAO Statement will be provided to the Chief Municipal Officer, the Board of Health, the Zoning Official, and the Building Code Enforcement Official, no less than 30 days after it has been recorded with the Norfolk County Registry of Deeds, pursuant to 310 CMR 40.1403(7)(a).

2. SITE BACKGROUND AND HISTORY

2.1 SITE LOCATION AND DESCRIPTION

The Site is located at 2 Canton Street (Route 27) in a mixed residential and commercial area of Stoughton, Massachusetts. The Property is identified by the Town of Stoughton's Assessor's Map 54 as Parcel 110, occupying approximately 2.16 acres of land. The Property, which is currently owned by Stoughton Center Business Park, LLC, is zoned for "general business". A Site Locus map (Figure 1) and a Site Plan (Figure 2) are attached. The coordinates of the Property are:

- Latitude / Longitude: 42.124298 / 71.104401
- UTM coordinates: 326049.4 mE, 4665506.5 mN (Zone 19)

The eastern portion of the Property consists of an asphalt-paved parking lot that is used for customer and commuter parking for the adjacent Massachusetts Bay Transit Authority (MBTA) commuter rail line. The western portion of the Property is currently improved with four interconnected, masonry and wood-framed mill buildings, which have a combined footprint of 73,046 square feet and are currently used for office, retail, studio, and storage space. An asphalt-paved courtyard area is situated within the center of these buildings, which also encompasses a fenced in playground area and limited customer parking. Each of the individual buildings has been assigned a name by the property owner and includes the "A," "B," "C," "D," "E," and "F" Buildings. As shown on Figure 2, the A-Building forms the northeastern boundary of the courtyard area, the B-Building forms the southeastern boundary, C-Building forms the southwestern boundary, the D- and E-Buildings form the western boundary, and the F-building forms the northwestern boundary. Note that only the A-, C- and F-Buildings are situated within the Disposal Site boundary. A covered overhead walkway connects the A-, C- and F-Buildings.

The A-Building is currently occupied by a variety of tenants including a framed art store, a martial arts studio, several artist studios, a house of worship, and a plumbing company; the F-Building is currently occupied by a day care facility and additional studio space; and the C-Building is occupied by a fitness center and an elevator shaft. None of the buildings contain a recessed basement, although small crawl spaces are located below the day care facility situated in the F-Building and the customer lobby situated within the A-Building.

The Site encompasses an approximately 5,200-square foot area located within the courtyard area of the Property, as well as portions of the A-, C-, and F-Buildings, occupying an approximate total area of 20,183-quare feet (Figure 2). Access to the Site is unrestricted and is obtained via an asphalt-paved driveway off of Canton Street adjacent to the eastern corner of the A-Building.

The Site is serviced with municipal water and sewer, natural gas, and electricity. A natural gas line runs along the southwestern portion of the Site within the courtyard area, parallel to the C-Building.

2.2 SITE SURROUNDINGS AND GENERAL SETTING

The Site is located in a mixed commercial and residential area of Stoughton, Massachusetts. Railroad tracks for the MBTA commuter line directly abut portions of the Property to the northeast and east. Canton Street borders the Site to the northeast, across from which is an MBTA vehicle parking lot and various commercial and residential properties. A commercial property and its associated parking lot abut the Site property to the west. Summer Street borders the Property to the south, across from which are several residential properties.

Review of the Massachusetts Geographic Information System (MassGIS; 2009) 21E Priority Resource Map (Figure 3) indicates that the Site is not located over or within 500 feet of a potentially productive aquifer, a Sole Source

aquifer, an Interim Wellhead Protection Area (IWPA), an approved Zone II groundwater supply area, or any other feature triggering a GW-1 classification. Additionally, there are no Areas of Critical Environmental Concern (ACECs), habitats of Species of Special Concern, habitats of Threatened or Endangered Species, fish habitats, vernal pools, or Protected Open Space located within 500 feet of the Site. The Site is not located in a 100-year floodplain. The nearest surface water body to the Site is a small unnamed brook and associated wetlands located approximately 3,000 feet downgradient to the southwest. Woods and Brittons Ponds are located further southwest of the Site.

2.3 OWNER / OPERATOR AND OPERATIONS HISTORY

Information regarding the historical use of the Property was obtained from information provided in previous environmental reports, including a review of Sanborn Fire Insurance Maps that were provided within the 2003 Phase I Initial Site Investigation (Continental Remediation Systems, Inc., 2003a).

As previously described, the Property currently consists of a commercial facility used for office, retail, studio, and storage space. The Property has been utilized for its current use since the early 1990s. Prior to that time, the Property had been used for manufacturing operations, including the manufacture of rubbing clothing between the late 1800s and the early 1930s and the manufacture of footwear between the 1930s and late 1960s.

Information obtained from available Sanborn Fire Insurance Maps indicates that the current buildings on the Property were in existence in 1912, with the current building configuration relatively unchanged since the late 1950s. Although three underground storage tanks (USTs) (one 500-gallon gasoline, one 6,000-gallon No. 6 fuel oil, and one 3,000-gallon No. 6 fuel oil) were removed from the Site between 1989 and 2008, they are not clearly depicted on any of the available Sanborn maps.

Sanborn maps also indicate the historic presence of railroad tracks to the immediate northeast of the Site. Additionally, the Stoughton Gas and Electric Co. was formerly located further north of the Site across Canton Street as depicted in the 1896, 1901, and 1906 Sanborns.

3. RELEASE HISTORY AND PREVIOUS RESPONSE ACTIONS

3.1 RELEASE HISTORY

In November 1989, a release of No. 6 fuel oil was discovered within the courtyard area of the Property during the removal of one (1) 500-gallon gasoline UST and one (1) 6,000-gallon No. 6 fuel oil UST. Subsequent investigation of soil at the Site identified petroleum-impacted soils within the footprint of the courtyard. At that time, it was determined that oil in soil associated with the 6,000-gallon tank did not appear to have migrated beyond the courtyard area. Also at that time, groundwater was found to be free of petroleum impact. MassDEP subsequently assigned RTN 4-00875 to the release in April 1990.

3.2 SUMMARY OF PRE-2008 RESPONSE ACTIONS AT DISPOSAL SITE

This section provides a summary of the response actions that have been performed for the Disposal Site associated with RTN 4-00875 prior to 2008. Response actions conducted by Woodard and Curran in 2008 and 2009 are described in Section 4.

On November 17, 1989 (pre-MCP), a release of No. 6 fuel oil was discovered within the courtyard area of the Site by Gale Associates, Inc. (Gale) during the removal of a 500-gallon gasoline UST and a 6,000-gallon No. 6 fuel oil UST. Specifically, petroleum impacts were encountered within the vicinity of the No. 6 fuel oil UST at approximately four feet below ground surface (ft bgs) and was observed to extend in both a northerly and southerly direction from the tank. In addition to the two USTs, approximately 20 cubic yards of petroleum-impacted soil were excavated from the courtyard area and removed from the Site.

In September 1989, six soil borings (B-1 through B-6) were advanced at the Property. Groundwater monitoring wells were installed within five of the borings (B-1, B-3, B-4, B-5, and B-6) with screen intervals ranging from 3.5 to 17 ft bgs. Soil samples were collected from borings B-1 and B-4 at depths ranging from 0.5 to 6 ft bgs and were submitted for laboratory analysis of total petroleum hydrocarbons (TPH) and/or extractable metals. Additional soil samples were collected from the tank excavation areas and were submitted for laboratory analysis of TPH and/or volatile organic compounds (VOCs). Results of the soil sampling indicated that concentrations of TPH were present in soil samples collected within the vicinity of the former No. 6 fuel oil UST.

In October 1989, groundwater samples were collected from the five monitoring wells installed at the Property in September 1989 and one existing monitoring well (B-7) and were analyzed for TPH, VOCs, base/neutral extractable organic compounds (B/Ns), oil/grease, and dissolved drinking water metals. TPH was detected in groundwater collected from the tank grave. Groundwater analytical data also indicated the presence of lead and barium in the groundwater sample collected from monitoring well B-3, located along the western edge of the Property. The presence of lead within groundwater was attributed to surface water runoff from nearby parking areas, while the presence of barium was attributed to indigenous soil and rock. Oil and grease were detected in groundwater samples collected from monitoring wells B-4 and B-6 (located along the southern and northern portions of the Property, respectively) and were attributed to surficial releases of oil/grease and/or off-site sources. No VOCs or B/Ns were detected in analyzed groundwater samples in October 1989 (Gale, 1989).

Six additional soil borings (B-8 through B-13) were advanced at the Property in January 1990 (Gale, 1990), one of which (B-8) was advanced outside of the courtyard area and was completed as a monitoring well. Soil samples were collected from borings B-9, B-10, B-11, and B-13 at depths ranging from 0 to 12 ft bgs and were analyzed for TPH. A groundwater sample was also collected from monitoring well B-8 and was analyzed for TPH and VOCs. Analytical results indicated that TPH concentrations ranging from 29 to 52,000 milligrams per kilogram (mg/kg) were detected in soil samples within the courtyard area of the Property, particularly those located between 6 and 12 ft bgs. The

groundwater sample collected from B-8 (located to the southeast of the Site building) did not contain detectable concentrations of TPH or VOCs.

According to the combined Immediate Response Action Completion Statement and Class C RAO Statement report prepared by Avier Environmental, Inc. (AE; 2006b), a 6x8x10 foot drywell containing sludge impacted with VOCs and metals was discovered along the western portion of the Property by Gale in January 1990. The contents of this drywell were later excavated and removed off-site in August 1990. Confirmatory soil samples collected from underlying soils indicated that no VOCs were detected, thereby indicating that contaminant migration from the dry well had not occurred. No additional work was conducted at the Site between August 1990 and October 1996.

In October 1996, Sage Environmental, Inc. (Sage) conducted an additional subsurface investigation at the Site, which confirmed the presence of No. 6 petroleum-impacted soils within the courtyard area at depths between 7 to 14 feet bgs. Additional subsurface activities were conducted by Sage in December 1997 and January 1998, consisting of the installation of four monitoring wells (MW-1 through MW-4) at the Property (MW-1 and MW-2 within the courtyard area; MW-3 and MW-4 within the footprint of the Site building), the advancement of one additional soil boring (B-1, located within the footprint of the building), the collection and laboratory analysis of soil and groundwater samples, and groundwater gauging. One soil sample was collected from each of the installed monitoring wells at depths ranging from 9 to 11 ft bgs and was submitted for laboratory analysis of extractable and volatile hydrocarbons (EPH/VPH) and TPH (for MW-1, MW-2, and MW-3 only). Additionally, one soil sample was collected from soil boring B-1 within the Site building and submitted for laboratory analysis of TPH. Analytical results of the 1997 and 1998 soil sampling indicated the presence of EPH and VPH constituents within soil samples collected from the courtyard area (MW-1 and MW-2), with the highest concentrations observed within MW-1, which is located along the southern corner of the courtyard area. Soil samples collected from MW-3 and MW-4 (both located within the building footprint) did not contain detectable levels of any analyzed constituents.

Groundwater samples were collected from MW-2 through MW-4 by Sage on January 5 and 22, 1998, which were analyzed for EPH and VPH. Groundwater analytical results indicated that low levels (i.e., below applicable RCGW-2 Reportable Concentrations) of VPH and/or EPH were detected in monitoring wells MW-2 and MW-4. The groundwater sample collected from MW-3 did not contain detectable concentrations of any analyzed constituents. Groundwater gauging data obtained in January 1998 indicated that groundwater flows in a south/southwesterly direction. Additionally, light non-aqueous phase liquid (LNAPL) was observed within monitoring well MW-1 with a measured thickness of 0.24 inches (Sage, 1998).

In 2002 and early 2003, additional investigations and pilot and/or full-scale in-situ chemical oxidation (ISCO) of subsurface soils were reportedly conducted, although the details of these activities are unclear.

In April 2003, a Phase I Initial Site Assessment and Tier Classification (classifying the Site as a Tier II disposal site) was filed for the Site by Continental Remediation Services, Inc. (CRS, 2003a). A Class A-2 Response Action Outcome (RAO) Statement was filed for the Site in June 2003 (CRS, 2003b), which concluded that, based on the results of a Method 1 risk characterization, no further response actions were necessary and a permanent solution had been achieved at the Site.

In September 2004, the Site was audited by the MassDEP who later issued a Notice of Audit Findings/Notice of Noncompliance (NOAF/NON) in November 2004 (MassDEP, 2004a) due to deficiencies cited in the Class A-2 RAO. Among other noted deficiencies, MassDEP found that a Method 1 RC was disqualified from use in the RAO due to the detection of the C9-C10 aromatic hydrocarbon fraction with a concentration greater than applicable Method 1 soil standards thereby invalidating the Class A-2 RAO. The audit also stated that soil characterization of the courtyard and potential indoor air impacts was inadequate.

Between September and December 2004, additional soil, groundwater, soil gas, and indoor air data were collected by Action Environmental, Inc. (AEI) to address the findings of the Audit (AEI, 2005a). These additional response actions included the re-sampling of soil within vicinity of MW-4 (labeled as AE-101) within the 8 to 10 ft bgs depth interval where a high PID response was previously recorded, as well as additional soil and groundwater sampling within the courtyard area. Additionally, AEI installed 11 soil gas sampling points (SG-1 through SG-11) at the Site and submitted four (4) soil gas samples (SG-1, SG-2, SG-7, and SG-11) collected within vicinity of the day care facility for laboratory analysis of air phase hydrocarbons (APH) to evaluate the potential for vapor migration into the occupied structures. Also, one (1) indoor air sample was collected from the crawl space located below the day care facility. The results of the supplemental investigation conducted by AEI in 2004 indicated that, while a critical exposure pathway did not exist at the Site in relation to vapor migration within the day care facility, additional response actions were necessary to address RTN 4-00875.

During groundwater gauging in October 2004, LNAPL with a measured thickness greater than its ½-inch Upper Concentration Limit (UCL) was observed within two ¾-inch piezometers (MW-6 and MW-7) on-Site, thereby triggering a 72-hour reportable condition. MassDEP was verbally notified by AEI of the release on November 1, 2004 and granted verbal approval of an IRA Plan for the bailing of NAPL from the monitoring wells and to conduct additional assessment of the Site. RTN 4-18753 was assigned to the release. RTN 4-18753 was later linked to the primary RTN 4-00875 via BWSC-107 in October 2005.

In January 2005, an IRA Plan was submitted by AEI to the MassDEP to address the NAPL release (AEI, 2005b). In February 2005, a Modified IRA Plan was submitted to MassDEP to perform pilot and full-scale ISCO of subsurface soils. ISCO remediation activities were conducted at the Site between March 2005 and June 2006. IRA Status reports were submitted to MassDEP in May 2005 and October 2005 (AEI, 2005c and 2006a, respectively), which summarized IRA activities that were conducted at the Site during each reporting period. IRA activities conducted between January 2005 and October 2005 included NAPL bailing from monitoring wells, installation of additional monitoring wells, pilot and full-scale ISCO treatment of subsurface soils, and post-treatment monitoring of soil and groundwater.

In August 2005, Phase II Comprehensive Site Assessment (CSA) and a Phase III Remedial Action Plan reports were submitted to MassDEP by AEI (AEI 2005d; 2005e, respectively), which summarized the Phase II assessment activities conducted at the Site between September 2004 and June 2005, as well as the selected remedial alternative to address subsurface contamination at the Site. Activities conducted during the Phase II included the advancement of additional soil borings and monitoring wells, soil and groundwater sampling, groundwater gauging, and a groundwater elevation survey. Additionally, a Method 1 RC was conducted, the results of which indicated that a condition of NSR had not been achieved at the Site. Therefore, it was concluded that additional response actions were necessary (AEI, 2005d). The selected remedial alternative was continued ISCO of soil and groundwater at the Site (AEI, 2005e), which would be conducted under the continuing IRA.

On September 7, 2006, a combined IRA Completion Statement and Class C-2 RAO Statement were submitted for the Site by Avier Environmental (AE; 2006b) indicating that IRA activities had been completed and that a Temporary Solution had been achieved. Ongoing activities related to the IRA continued under a RAM.

In September 2006, AE submitted a RAM Plan (AE, 2006c) outlining proposed RAM activities for the Site, which included the installation of two additional soil borings/monitoring wells, the gauging and monitoring of groundwater quality within the monitoring well network, and post-remedial monitoring to determine and document the effectiveness of the response actions. A RAM Status report summarizing RAM activities conducted at the Site in November 2006 was submitted to MassDEP in February 2007 (AE, 2007). According to the RAM Status report, groundwater monitoring, a groundwater flow survey, and NAPL measurement and bailing were conducted in November 2006. The RAM Status report also presented a modification to the previous RAM Plan, which proposed the installation of four,

rather than two, monitoring wells at the Site to delineate the extent of NAPL. These additional soil borings/monitoring wells were never installed at the Site.

4. W&C RESPONSE ACTIONS

This section describes the investigation and remediation activities completed at the Site by Woodard and Curran between August 2008 and the present.

4.1 RELEASE ABATEMENT MEASURE ACTIVITIES

In July 2008, Woodard & Curran was retained by Stoughton Center Business Park, LLC for environmental services in relation to the fuel oil release associated with RTN 4-00875. In August 2008, W&C submitted a RAM Plan (W&C, 2008a) for the Site which superseded the September 2006 RAM Plan previously prepared by Avier Environmental and associated modifications outlined in the February 2007 RAM Status Report. The objective of the August 2008 RAM was to remove petroleum-impacted soils that were acting as a continuing source of NAPL previously observed in monitoring wells.

On August 13, 2008, W&C personnel conducted gauging of the nine monitoring wells (MW-1, MW-4, MW-5, MW-6, MW-7, AE-201, AE-202, AE-203, AE-204) that were present at the Property at that time to better understand Site conditions prior to initiation of RAM activities. Depth to groundwater during the August 2008 gauging event ranged from approximately 4.8 ft bgs within former monitoring well MW-5 (within the courtyard area) to 10.32 ft bgs within monitoring well AE-202 (adjacent to Canton Street). NAPL with an approximate thickness of 0.02 feet was observed within monitoring well MW-7, which was formerly located within the center of the courtyard (near the fenced in playground). NAPL was also observed to be present with considerable thickness within monitoring well MW-6, which was formerly located adjacent to the current location of WC-2 within the courtyard area. W&C was unable to estimate the measurable thickness of the NAPL in this well due to the high viscosity of the product (which continually became entrained within the interface probe). No other wells were found to contain NAPL during the August 13, 2008 gauging event.

RAM activities began on August 20, 2008 and were completed on August 29, 2008. The general approach for the RAM was to work in sections within the courtyard area to reduce the weight-bearing burden on nearby compacted soils and adjacent structures, and for health and safety reasons. As a result, several smaller excavations were conducted and backfilled rather than having one large open excavation area. In general, the excavation area was separated into four quadrants: northeast, northwest, southeast, and southwest. All excavation activities were conducted by Cyn Environmental (Cyn) of Stoughton, Massachusetts (under subcontract to, and direction of, W&C). Headspace screening was continually conducted during excavation activities using a photoionization detector (PID) equipped with a 10.6 electron volt (eV) lamp to monitor work space and to help guide excavation of impacted soils. Excavation of each area continued until soils no longer appeared visually impacted or until further excavation was impeded by the presence of surrounding structures and/or the influx of groundwater into the excavation. Prior to backfilling each quadrant, grab soil samples were collected from the bottom and side walls of each quadrant, which were later composited into five soil samples representative of the bottom and four side walls of the main excavation area (i.e., all four quadrants) conducted under the RAM.

Excavation activities began in the southwest quadrant, which was anticipated to be the most heavily impacted area of the Site based on NAPL measured in monitoring wells within this area during the August 13, 2008 gauging event. In general, the top 6-8 feet of unimpacted overburden soils were excavated and temporarily stockpiled for re-use as back fill. Overburden soils were observed to consist of sandy fill materials containing coal ash, cinders, brick, glass and slag from the ground surface to approximately 7 feet bgs, followed by a 1-2 foot thickness of brown peat. Petroleum-impacted soils were observed at depths ranging from 8-13 feet bgs. A dense lodgment till layer consisting of fine sand, silt, and clay was encountered within each excavation area at depths ranging from approximately 12-16 feet bgs. Oil was also observed along (and in some areas embedded within) the clay layer. Visually impacted oily

soils and clay were excavated to an approximate average depth of 12.5 feet bgs when groundwater slowly began to percolate into the bottom of the excavation.

During implementation of the RAM, an IRA condition was triggered due to the discovery of an unknown, abandoned 3,000-gallon fuel oil UST within the west/southwestern portion of the Site. Therefore, excavation activities associated with the newly discovered tank were conducted separately under an IRA, while the remainder of excavation activities at the Site was conducted under the RAM. Response actions conducted under the IRA are discussed further in Section 4.2.

Approximately 850 cubic yards of material (both unimpacted and impacted) was generated during RAM/IRA excavation activities, of which roughly 386 cubic yards consisted of petroleum-impacted material and were transported by Cyn off-site for disposal at Aggregate Industries in Stoughton, Massachusetts. The removed 3,000 gallon fuel oil UST was transported off-site by Cyn to the James G. Grant Co. Inc. facility located in Readville, Massachusetts. Several large boulders, and minor amounts of construction debris consisting of concrete (e.g., foundation/conduits), brick, and field stone were also encountered at varying depths across the Site during excavation activities, some of which was retained for use as backfill in the excavation.

As depth to groundwater at the Site ranges from approximately 6 to 10.5 feet bgs, some dewatering activities were required. Approximately 213 gallons of an oil/water mixture were generated over the course of the RAM and IRA. The generated water was pumped out using a vacuum truck and transported offsite to Cyn's Stoughton facility under a Hazardous Waste Manifest as a waste.

As previously described, confirmatory soil samples that were collected throughout the course of the RAM were composited into representative samples reflecting the bottom and sidewalls of the main excavation area (i.e., the larger excavation conducted under the RAM) following completion of excavation activities. The confirmatory samples were submitted for VPH and EPH, both with target analytes. Analytical results for the soil sampling are discussed in Section 4.3.

Because the existing monitoring well network within the courtyard area was destroyed during implementation of RAM and IRA activities, three monitoring wells were installed in this area upon completion of RAM/IRA activities on August 28, 2008 to define post-excavation Site conditions. The details of monitoring well installation and subsequent sampling of groundwater from these wells is discussed in Section 4.4. Soil samples were not obtained during installation of the three replacement wells because representative soil samples were collected from the area following excavation activities (i.e., confirmatory soil sampling).

Upon completion of RAM and IRA excavation activities at the Site, the entire courtyard area was re-graded with approximately 18 inches of bluestone and finished with asphalt pavement. Re-grading and paving activities were conducted between September 2 and 4, 2008, and included the installation of a fenced-in area finished with 3 feet of bark mulch on top of the asphalt pavement along the northwestern portion of the Site, which currently used as an outdoor play area for the on-Site day care facility.

4.2 IMMEDIATE RESPONSE ACTION ACTIVITIES

As previously mentioned, an IRA condition was triggerd during implementation of RAM activities at the Site due to the discovery of an unknown, abandoned, leaking 3,000-gallon fuel oil UST within the west/southwestern corner of the Site. The tank was discovered during excavation of the west/southwestern quadrant on August 25, 2008. At approximately 1:00pm, a portion of a steel tank was observed protruding from the northeastern corner of the southwestern quadrant, adjacent to a former dry-well structure. Further excavation of soils surrounding the northern half of the tank revealed an access portal within the tank. At that time, excavation activities ceased, the tank was opened, and the contents of the tank were pumped into the vacuum truck. It was estimated that approximately 1.5

feet of an oil/water mixture was present in the tank. The Stoughton Fire Department was promptly notified of the tank discovery. The remainder of the day was spent by Cyn cleaning out the contents of the tank.

On August 26, 2008, following approval from, and under a permit granted by, the Stoughton Fire Department, Cyn began excavation of the tank. As compacted soils surrounding the tank were excavated, petroleum-saturated soils were noted in underlying soils, thereby triggering a new reporting condition. The MassDEP was verbally notified of the 2-hour release at approximately 11:30am by John Thompson of W&C, the LSP for the Site. MassDEP verbally granted approval for the removal of the tank, as well as up to 25 cubic yards of impacted soils under an IRA. Release Tracking Number 4-21470 was assigned by MassDEP to the 2-hour release, which was later linked to the primary RTN (4-00875) via BWSC-105 on October 23, 2008.

Upon its removal, the newly discovered fuel oil tank was estimated to have a capacity of approximately 3,000-gallons. Numerous holes of all sizes (including an approximately 8" gash along the northeast corner) were noted along the tank bottom and sidewalls. It appeared that some holes were likely due to puncture of the tank during the earlier application of ISCO.

As the oil observed in and around the newly discovered UST was similar to the NAPL previously encountered in Site monitoring wells, as well as within the southwest quadrant, it was difficult to segregate fuel oil impacts resulting from the formerly removed 6,000-gallon fuel oil UST and the abandoned 3,000-gallon fuel oil UST. As such, excavation of soils within the southwest quadrant continued under the IRA, while soils within the remainder of the excavation (and upgradient of the 3,000-gallon UST) were handled under the RAM already in progress (as previously described in Section 4.1). It is estimated that approximately 20 cubic yards of petroleum-impacted soils were excavated and transported off-site under the IRA.

Following excavation and stockpiling of impacted soils within the vicinity of the newly discovered UST, four confirmatory soil samples were collected from the bottom and southern, western, and northern sidewalls, field screened, and placed on ice for future laboratory submittal. The excavation was then backfilled with imported bluestone.

A combined Release Abatement Measure Completion and Immediate Response Action Completion report (W&C, 2008b) was submitted to MassDEP on October 23, 2008, describing the RAM and IRA activities that were conducted at the Site in August 2008.

4.3 CONFIRMATORY SOIL SAMPLING

Following excavation activities at the Site, W&C collected a total of nine confirmatory soil samples from the bottoms and side walls of the two excavation areas to characterize post-remediation conditions at the Site. Specifically, five soil samples were collected from the main excavation area (Bottom, East Side Wall, South Side Wall, West Side Wall, and North Side Wall), and four soil samples were collected from the UST excavation area (UST-Bottom, UST-SW South, UST-SW West, and UST-SW North). Soil samples were submitted to Alpha Analytical Laboratories (Alpha) for analysis of VPH and EPH, both with target analytes. A summary of soil analytical results is presented on Table 1. As shown, VPH and EPH fractions, as well as several PAHs were detected in one or more soil samples. C11-C22 aromatic hydrocarbons and C19-C36 aliphatic hydrocarbons were detected in all nine samples, the highest concentrations of which were detected within the RAM excavation area. Lighter fractions C9-C10 aromatic hydrocarbons and C9-C12 aliphatic hydrocarbons were detected in four soil samples: three within the RAM excavation area and one within the IRA excavation area. Of the eleven detected PAHs, eight of them had maximum detected concentrations below MassDEP background values for 'natural' soils (MassDEP, 2002a); acenaphthene, naphthalene and 2-methylnaphthalene were the only three PAHs detected with maximum concentrations greater than applicable background values. The C9-C10 aromatic hydrocarbon fraction was the only constituent detected

with a concentration (176 mg/kg) greater than its most stringent Method 1 standard (100 mg/kg; S-1/GW-2), which was collected from the bottom of the main excavation area. Laboratory analytical reports for confirmatory soil samples collected at the Site in August 2008 are presented in Appendix B.

4.4 MONITORING WELL INSTALLATION

4.4.1 August 2008

In August 2008, W&C contracted with Geosearch, Inc. (Geosearch) of Fitchburg, Massachusetts to install three (3) monitoring wells (WC-1 through WC-3) at the Site using hollow stem auger techniques. The objective of the well installation was to establish a monitoring well network within the courtyard area to replace those destroyed during excavation activities. The intent was to install the wells to an approximate depth of 20 ft bgs; however, due to refusal that was encountered in several locations across the southern half of the courtyard, two of the wells (WC-1 and WC-2) were installed to approximately 13-15 ft bgs, as described below.

The monitoring wells were installed on August 28, 2008 and were each constructed of six-inch diameter schedule-40 polyvinyl chloride (PVC) with a screen slot size of 0.01 inch. WC-1 was installed to an approximate depth of 15 ft bgs, WC-2 to approximately 13 ft bgs, and WC-3 to approximately 19 ft bgs. Each of the wells was screened across the bottom 10 feet, with the screen straddling the water table (ranging from 6 to 9 ft bgs in this area of the Site). A sand pack was placed in the annular space between the borehole and the well and was extended one to two feet above the screen. A two-foot bentonite seal was placed above the sand pack and sand was extended to the surface. The wells were completed with flush-mounted roadboxes following subsequent re-paving of the entire courtyard area between September 2 and 4, 2009. Monitoring well construction details for monitoring wells WC-1 through WC-3 are presented on the drilling logs included in Appendix C.

4.4.2 June 2009

In June 2009, W&C contracted with New England Geotech (NEG) of Jamestown, Rhode Island to install two (2) additional monitoring wells (WC-4 and WC-5) at along the northern portion of the Property to further delineate Site conditions within this area. Field activities were conducted on June 30, 2009. Monitoring well WC-4 was installed to an approximate depth of 14.5 ft bgs using direct push drilling techniques along the northwestern corner of the Property in the alley way between the A- and F-Buildings. WC-4 was constructed of one-inch diameter schedule-40 PVC with a screen slot size of 0.01 inch, and was screened over the bottom ten feet, with the screen straddling the water table (approximately 8 ft bgs). A sand pack was placed in the annular space between the borehole and the well and was extended one to two feet above the screen. A two-foot bentonite seal was placed above the sand pack and sand was extended to the surface. The well was completed with a flush-mounted roadbox.

Prior to completion of the second proposed monitoring well (WC-5) within the grassy area adjacent to Canton Street near the northern corner of the Site building, an existing well (B-6, which was apparently installed in December 1989) was discovered within the vicinity of proposed WC-5 and was in good condition; therefore, WC-5 was not installed.

Monitoring well construction details for monitoring well WC-4 are presented on the drilling logs included in Appendix C.

4.5 GROUNDWATER AND NAPL GAUGING

Numerous gauging events have been conducted at the Site between August 13, 2008 and June 30, 2009. Gauging was conducted using an oil/water interface probe, and each well was gauged to the highest point on the PVC riser within the well. A summary of each of the gauging events is provided below.

As previously described, W&C conducted a gauging event prior to implementation of RAM activities in August 2008 that included all nine of the monitoring wells that were present at the Property at that time. NAPL with an approximate thickness of 0.02 feet was observed within monitoring well MW-7, formerly located within the center of the courtyard. NAPL was also observed to be present within monitoring well MW-6, which was formerly located adjacent to the current location of WC-2 within the courtyard area. W&C was unable to estimate the measurable thickness of the NAPL in this well due to the high viscosity of the NAPL.

Since several of the monitoring wells that were formerly located in the courtyard area were destroyed in the process of the RAM excavation, three replacement monitoring wells (WC-1, WC-2, and WC-3) were installed in the courtyard area following RAM activities. These three courtyard wells were gauged a total of twelve times between November 10, 2008 and June 30, 2009 to document fluctuations in groundwater elevation and NAPL thickness. NAPL was not observed within WC-1 or WC-2 during any of these twelve gauging events. However, residual levels of NAPL were observed within WC-3 following excavation activities. NAPL was initially observed in WC-3 with an approximate thickness of 0.01 foot on November 10, 2008.

The remaining monitoring wells located outside of the courtyard area (WC-4, B-6, MW-4, AE-202, and AE-203) were each gauged prior to each groundwater sampling event. NAPL has not been observed in any monitoring wells following excavation activities other than WC-3.

Average depth to groundwater observed within the courtyard area following excavation activities is approximately 8 ft bgs. Depth to groundwater outside of the courtyard area ranges from 6.21 ft bgs at MW-4 (inside the fitness center) to 10.42 ft bgs at AE-202 (in grassy area adjacent to Canton Street and the eastern-most corner of the Site building). A summary of depth to groundwater measurements and NAPL measurements are presented in Table 2.

4.6 VACUUM EXTRACTION

Prior to each sampling event (generally the day before each groundwater sampling event), W&C contracted with Cyn to conduct vacuum extraction of the three courtyard monitoring wells to facilitate well development, purging of stagnant water within the water column, and removal of measurable NAPL within present in WC-3. During each "vac-out" event, each of the courtyard wells was pumped three separate times for approximately 20 to 30 minutes each, allowing for groundwater re-charge in between rounds. Monitoring well WC-4 (installed on June 29, 2009) and existing monitoring well B-6 (discovered on June 29, 2009) were also developed via vacuum extraction during the June 30, 2009 vac-out event. Waste manifests documenting proper disposal of the oil and water mixture generating during each vac-out event are provided in Appendix D. A summary of the total extracted amount during each vac-out event (cumulative among all wells) is provided on the following table:

Date	Total Amount Extracted (gallons)
11/10/2008	99
4/14/2009	105
5/14/2009	144
5/29/2009	142
6/15/2009	99
6/30/2009	316

4.7 GROUNDWATER SAMPLING

W&C collected groundwater samples during three separate groundwater sampling events conducted on November 12, 2008, April 15, 2009, and July 1, 2009. Monitoring wells WC-1, WC-2, WC-3, MW-4, AE-202, and AE-203 were sampled during each of the three sampling events, while WC-4 and B-6 were each only sampled during the July 2009 sampling event (following installation/discovery).

As previously described, W&C gauged each well prior to sampling using an oil/water interface probe. Additionally, vacuum extraction was conducted within the three courtyard wells prior to each of the sampling events, and within the two newly installed/discovered wells (WC-4 and B-6) prior to the June 2009 sampling event.

Immediately prior to sampling, each well was developed by purging approximately three well volumes using a peristaltic pump. A peristaltic pump was used to collect groundwater sampling via low flow/low stress sampling techniques in order to limit the evacuation rate and drawdown of each well. A groundwater sample was collected from each well into pre-preserved containers provided by the analytical laboratory, packed on ice, and submitted under chain-of-custody protocol to the applicable laboratory for analysis of EPH and VPH, both with target analytes. Groundwater samples collected in November 2008 were submitted to Resource Laboratories, Inc. (RL), while groundwater samples collected in April and July 2009 were submitted to Alpha.

Of the eight monitoring wells sampled between November 2008 and July 2009, only two contained detectable concentrations of analyzed constituents: WC-1 and WC-3. Only three constituents (C9-C10 aromatics, C11-C22 aromatics, and C19-C36 aliphatics) were detected in groundwater samples collected from WC-1, which is located along the southern portion of the courtyard. Groundwater samples collected from monitoring well WC-3 (located along the northern portion of the courtyard) exhibited the highest frequency of detection and the highest detectable concentrations of VPH and EPH constituents among the three Site monitoring wells. The following constituents were detected in groundwater samples collected from this monitoring location during at least one of the three groundwater monitoring events: C9-C10 aromatic hydrocarbons, C9-C12 aliphatic hydrocarbons, benzene, ethylbenzene, o- and m/p-xylenes, C11-C22 aromatic hydrocarbons, 2-methylnaphthalene, naphthalene, acenaphthene, and fluorene. VPH and EPH hydrocarbon fractions (C9-C10 aromatics, C9-C12 aliphatics, C11-C22 aromatics, and C19-C36 aliphatics) were those constituents that exhibited the highest detected concentrations in Site groundwater (180, 130, 213, and 210 micrograms per liter [ug/L], respectively). The remaining EPH and VPH constituents that were detected in groundwater exhibited much lower concentrations than hydrocarbon fractions.

Groundwater analytical results are summarized in Table 3. Laboratory analytical reports for each groundwater sampling event are presented in Appendix B.

4.8 SOIL GAS PROBE INSTALLATION AND SOIL GAS SAMPLING

On April 15, 2009, three permanent soil gas sampling points were installed at the Site, which were located adjacent to each of the three courtyard monitoring wells and within fifteen feet of the existing buildings (Figure 2). In general, the soil gas probes were installed in accordance with MassDEP's "Standard Operating Procedure for Indoor Air Contamination" (MassDEP 2007b) (Toolbox 3). The sampling points were installed by drilling through the asphalt pavement and advancing stainless steel sampling ports attached to Teflon tubing to approximately one foot above the water table (6.5 ft bgs for SG-1; 6 ft bgs for SG-2 and SG-3). The tubing was run through a rubber stopper inside a protective PVC sleeve which was cemented into the pavement and secured with a flush-mount road box. The tubing was purged and readings were collected using a PID. Thirty minute composite samples were then collected from each of the sampling locations using 2.7 L Summa© canisters equipped with low-flow regulators (< 10 ml/min air flow). Samples were submitted to Alpha for analysis for APH.

A summary of soil gas data collected at the Site on April 15, 2009 is presented in Table 4. The Laboratory analytical report for these air data is presented in Appendix B. As shown on Table 4, seven APH constituents were detected in one or more soil gas samples collected from the Site: benzene, C5-C8 aliphatics, C9-C10 aromatics, C9-C12 aliphatics, m&p- and o-xylenes, and toluene. For all constituents except C9-C12 aliphatics, the highest detected concentrations were observed in the soil gas sample collected from SG-1, which is located adjacent to monitoring well WC-3 (within the northern corner of the courtyard area and where residual NAPL remains). For C9-C12 aliphatics, the highest concentration was found in the soil gas sample collected from SG-2, which is located adjacent to monitoring well WC-1. Soil gas concentrations were compared to MassDEP soil gas screening levels for evaluating indoor air impacts (MassDEP 2002b). As shown on Table 4, all detected constituent concentrations in soil gas were below their respective MassDEP soil gas screening levels, thereby indicating that vapor intrusion impacts to the Site building are unlikely.

4.9 INDOOR SAMPLING

On June 30, 2009, W&C collected an indoor air sample from the on-Site day care facility to evaluate the potential for vapor intrusion from the subsurface to indoor air. The indoor air sample was collected over a twelve-hour period using a 6L Summa© canister equipped with a low-flow regulator (< 10 ml/min air flow). The air sample was submitted to Alpha Woods Hole Labs (Alpha Woods Hole) for analysis of EPA Method TO-15 (Modified) and to Alpha for analysis of APH. Modification of the TO-15 analysis is an expansion of the target analyte list for more than 80 volatile paraffin, isoparaffin, aromatic, naphthene, and olefin (collectively known as "PIANO") compounds and was requested in support of forensic paneling of the indoor air and ambient air samples, as further described in Section 4.12.

Three APH constituents were detected in the indoor air sample collected in June 2009: toluene, C5-C8 aliphatics, and C9-C12 aliphatics. Of these, C9-C12 aliphatics were detected with the highest concentration (499 microgams per cubic meter [ug/m^3]). Given that concentrations of this constituent in soil gas samples (which were collected from the subsurface, within closer proximity both laterally and vertically to the Site and residual NAPL in WC-3) were lower than that observed within IA-101 and because the measured concentrations of constituents in indoor air (particularly that measured for C9-C12 aliphatics) did not correlate with the results of the petroleum paneling conducted for the NAPL sample (which, if present, would be the suspected source of indoor air contamination as a result of the Site release), background interferences were suspected.

Accordingly, a Site walk through was conducted and building occupants were interviewed to collect information that might reveal an alternate contributing source of petroleum hydrocarbons to indoor air. During the walk through, it was discovered that the filter within the furnace servicing the central air conditioning system was clogged and had not been changed in well over a year. Furthermore, it was discovered that the central air conditioning was inappropriately configured (i.e., it was configured to recirculate the air within the day care, rather than draw on an outdoor source of fresh air). It was also discovered that cleaning crews were allowed to smoke cigarettes while servicing the Site building each night. Appropriate modifications were subsequently made to the central air conditioning and additional indoor air sampling was conducted on August 6, 2009, including the collection of one indoor air sample from the fitness center in the C-Building (IA-102); one within the day care facility within the same vicinity as IA-101 (IA-103); one within the crawl space beneath the day care (IA-104); and, one within the lobby area of the F-Building (IA-105). All four indoor air samples collected in August 2009 were submitted to Alpha for laboratory analysis of APH. A summary of APH indoor air analytical data is presented on Table 5. Analytical laboratory reports for indoor air data (for both APH and TO-15 analysis) are provided in Appendix B.

Analytical results for the August 2009 indoor air sampling event indicate that concentrations of petroleum hydrocarbons dropped significantly between the two sampling rounds, thereby confirming that background interference contributed to the concentrations of petroleum hydrocarbons observed in the June 2009 sampling round.

Therefore, the indoor air sample collected in June 2009 (IA-101) is considered to be unrepresentative of Site conditions.

Toluene, C5-C8 aliphatics, and C9-C12 aliphatics were again, the only three constituents detected in indoor air during the August 2009 sampling round. The maximum detected concentration of each constituent was found in the sample collected from the fitness center (IA-102). A comparison of indoor air data to Residential Typical Indoor Air Concentrations (MassDEP 2008a) indicates that, with the exception of data obtained from IA-102, the maximum detected concentrations of C5-C8 and C9-C12 aliphatics are below the 75th percentile value for typical indoor air concentrations within a residence, while the maximum detected concentration of toluene is below the 50th percentile concentration for the August 2009 indoor air samples. It was concluded that the elevated concentrations found within IA-102 are likely attributed to background conditions associated with building construction itself (and/or the operations conducted within) rather than being a result of the former release. The logic behind this is that no VOCs or VPH have ever been detected in soil or groundwater samples collected within this location (MW-4 and AE-101), as previously described, and no NAPL has been documented at MW-4 since its installation in 1998. Additionally, concentrations of volatile constituents in soil gas collected outside of the fitness center indicate that soil gas concentrations are below MassDEP screening levels that are likely to result in indoor air impacts. Regardless, the fitness center was conservatively included in the Disposal Site Boundary and the data points obtained from within the fitness center (soil, groundwater, and indoor air) were retained for use in the risk characterization (presented in Appendix E).

Results of TO-15 analysis are discussed in Section 4.12. The TO-15 indoor air data were not used in the risk characterization but represent an additional line of evidence in the evaluation of the vapor intrusion pathway as described in Section 4.12.

4.10 AMBIENT AIR SAMPLING

Ambient air samples were collected concurrently with soil gas samples collected in April 2009 and the indoor air sample collected in June 2009. The ambient air sample collected in April 2009 (labeled as "Ambient") was collected from the center of the courtyard area, adjacent to the children's play ground, using a 2.7L canister. The ambient air sample collected in June 2009 (labeled as "AA-101") was collected from the northern most corner of the courtyard area, using a 6L canister. Both ambient air samples were submitted for laboratory analysis of APH. As shown on Table 6, no analyzed constituents were detected in ambient air in April 2009, while C5-C8 aliphatics was the only constituent detected in ambient air in August 2009. The laboratory analytical reports for ambient air samples are presented in Appendix B.

4.11 NAPL SAMPLING

Forensic profiling was conducted on a sample of oil collected from monitoring well WC-3 to evaluate if any volatile hydrocarbons measured in indoor air originate with residual NAPL at the Site. On June 30, 2009, W&C collected a NAPL sample from monitoring well WC-3 and submitted it to Alpha Woods Hole for laboratory analysis of EPA Methods 8015 (Modified) and 8260 (Modified). EPA Method 8015 provides a high resolution 'fingerprint' of the NAPL, from which product composition can be determined. EPA Method 8260 measures over 80 volatile chemicals found within the PIANO classes and provides a detailed compositional profile of volatile hydrocarbons that compose NAPL.

The compositional features of NAPL were determined using gas chromatography analysis of the oil sample collected from WC-3, as described in the data deliverable report prepared for W&C by New Fields Environmental (New Fields; 2009). Results of the NAPL forensic profiling indicate that the product was composed of a mixture of petroleum fuels consisting of approximately 80% C10-C25 hydrocarbons (consistent with the features of diesel/Fuel #2 oil) and approximately 20% C25-C40 hydrocarbons (consistent with the features of a heavy fuel oil). Results also indicate

that the NAPL is moderately weathered. The NAPL sample exhibited very low concentrations of volatile hydrocarbons and no benzene was found in the sample. In addition to determining the relative composition of the NAPL, New Fields also estimated what the vapor phase composition of each volatile hydrocarbon present in the NAPL would potentially be using Raoult's Law. This information was later compared to the indoor and ambient air composition, the results of which indicate that the chemistry of the NAPL vapor and that of indoor air are different and that NAPL is likely not the source of volatile hydrocarbons found in indoor air. Further description of NAPL forensic profiling, NAPL vapor, indoor air, and ambient air is provided in Section 4.12.

The laboratory analytical report for the NAPL sample is presented in Appendix B. The Newfields report is included in Appendix F.

4.12 PETROLEUM PANELING

As previously described in Section 4.11, W&C contracted with New Fields to conduct forensic profiling of NAPL, as well as indoor air and ambient air samples collected at the Site in June 2009, the results of which would be used to evaluate whether volatile hydrocarbons measured within indoor and/or ambient air are due to the presence of residual NAPL at the Site. Fingerprinting and compositional analysis of a NAPL sample from WC-3 was conducted and compositional analysis of one indoor air (IA-101) and one ambient air (AA-101) was conducted and reported out by New Fields (refer to Appendix F). Air samples were submitted to Alpha Woods Hole for analysis of EPA Method TO-15 (Modified). Modification of the TO-15 analysis is an expansion of the target analyte list for more than 80 volatile paraffin, isoparaffin, aromatic, naphthene, and olefin (collectively known as "PIANO") compounds, which is useful for compositional and source analysis.

Results of the TO-15 analysis indicate that concentrations of volatile hydrocarbons in indoor air as measured by TO-15 were relatively low; toluene was the constituent with the highest detected concentration 5.01 ug/m^3 in IA-101. Concentrations of other constituents were less than 5 ug/m^3. The hydrocarbon class composition of the volatile hydrocarbons present within IA-101 was found to be Paraffins (30%); Isoparaffins (27%); Aromatics (34%); Naphthenes (6%); and Olefins (2%). BTEX compounds (benzene, toluene, ethylbenzene, and xylenes), dominated by toluene, made of 22% of the volatile organics measured in IA-101. Benzene was detected in indoor air at 0.766 ug/m^3.

Similarly, concentrations of volatile hydrocarbons in the ambient air sample AA-101 were low, with toluene being the highest detected constituent (1.02 ug/m^3). The hydrocarbon class composition of the volatile hydrocarbons present within AA-101 was found to be Paraffins (20%); Isoparaffins (34%); Aromatics (36%); Naphthenes (6%); and Olefins (4%). BTEX compounds, dominated by toluene, made of 26% of the volatile organics measured in AA-101. Benzene was detected in indoor air at 0.383 ug/m^3.

Results of the petroleum profiling of air and NAPL indicate that the volatile hydrocarbon chemical compositions between indoor air and NAPL vapor are significantly different. Most significantly, the indoor air contains 2% olefins (relatively unstable hydrocarbons in the environment) whereas the NAPL vapor contains no such olefin chemicals. Furthermore, the indoor air hydrocarbon composition and the outdoor air composition are much more similar in relative composition and both contain approximately the same proportions of PIANO compounds, including olefins.

Based on the results of the petroleum profiling, W&C asserts that the concentrations of volatile constituents (contained within both TO-15 and APH) measured in indoor air are not attributed to residual amounts of NAPL at the Site but are instead reflective of background conditions at the Site (i.e., building configuration, use of cleaning chemicals within the individual tenant spaces, smoking in the building, and/or ambient air). This argument is bolstered by the fact that lower concentrations of detected constituents were found in the indoor air sample collected from the crawl space beneath the day care facility than those collected from the floor above the crawl space.

Furthermore, results of the petroleum profiling indicate that ambient air could also be a source of volatile hydrocarbons observed within indoor air, as the indoor and ambient air samples analyzed in June 2009 were more compositionally similar to each other rather than either one resembling the NAPL profile and the ambient air sample collected in August 2009 exhibited detectable concentrations of C5-C8 aliphatic hydrocarbons.

4.13 SITE SURVEY

On July 17, 2009, W&C performed a survey of all eight existing monitoring wells at the Property (WC-1, WC-2, WC-3, WC-4, B-6, MW-4, AE-202, and AE-203) to document relative groundwater elevations and to determine groundwater flow direction. Elevations were surveyed relative to an arbitrary benchmark of 100.00 feet established on the 2 Canton Street property. Based on gauging data and information obtained from the Site survey, it was concluded that a distinct groundwater flow direction could not be calculated. Similarly, information contained in previous reports indicates an inconsistent groundwater flow direction; with some reports citing a southerly flow, while other cite south/southwesterly and southeasterly flow directions. It is likely that subsurface structures and/or the presence of underground utilities influence groundwater flow patterns underneath the Site. Based upon regional geography and the distribution of hydrocarbons released at the site, the groundwater flow is likely flowing towards the south/southwest across the Site.

5. SITE CONDITIONS

5.1 SITE GEOLOGY AND HYDROGEOLOGY

The following sections present an assessment of the topography, overburden soil and bedrock geology, and hydrogeologic conditions at the Site.

5.1.1 Topography and Surface Water

Based on information presented in the Phase II CSA (AE, 2005d), the ground surface of the Site ranges from approximately 216-226 feet above mean sea level. The topography of the Property is relatively flat, gently sloping downward from the northwest to the southeast.

The closest surface water to the Site is a small unnamed brook and associated wetland areas located approximately 3,000 feet to the southwest. Woods and Brittons Ponds and associated wetlands are situated further southwest of the Site. There are no wetlands within 500 feet of the Site.

5.1.2 Overburden and Bedrock Geology

Based on Site observations, overburden soils were observed to consist of sandy fill materials containing coal ash, cinders, brick, glass and slag from the ground surface to approximately 7 feet bgs, followed by a 1-2 foot thickness of brown peat. A dense lodgment till layer consisting of fine sand, silt, and clay was encountered within each excavation area at depths ranging from approximately 12-16 feet bgs. Soil beneath the confining layer generally consists of fine to medium sand. These soils and stratigraphy indicate a distal glaciofluvial or glaciolacustrine depositional environment for native soils, overlying lodgement till.

Bedrock outcrops are not present at the Site or on the 2 Canton Street property. Bedrock was not encountered during Site investigation; however, refusal was encountered at several locations during monitoring well installation within the courtyard area at an approximate depth of 13 ft bgs. According to the Bedrock Geologic Map of Massachusetts (Zen, 1983), the subject property is underlain by Dedham Granite of the Proterozoic Z era within the Milford-Dedham Zone (tertiary and older rocks), which consists of light grayish-pink to greenish-gray, equigranular to slightly porphyritic, variably altered, granite south and west of Boston.

5.1.3 Site Hydrogeology

Information obtained from previous Site investigations and field observations indicated that groundwater generally flows in a south/southwesterly direction across the Site and is encountered at depths of approximately 6 to 10 feet below ground surface. As previously mentioned in Section 4.13, evaluation of the recent groundwater elevation data from the groundwater monitoring wells located on the Property (WC-1, WC-2, WC-3, WC-4, MW-4, AE-202, AE-203 and B-6) indicates that current hydrogeologic conditions are variable, with likely influences from underground structures and/or utilities. As indicated in the Phase II CSA Report (AE, 2005d), groundwater velocity is estimated to be approximately 105 feet/year, based on a soil permeability for fine sand (fill) of 3.6 feet/day and a porosity of 30%.

5.2 NATURE AND EXTENT OF THE DISPOSAL SITE

5.2.1 Soil

The source of release is two leaking fuel oil USTs formerly located at the Site. Based on information obtained from previous site investigations and recent Site observations, the extent of petroleum impacted soil at the Site is

estimated to cover an area of approximately 5,200 square feet. The thickness of soil impacted by fuel oil over this area (prior to its excavation) is estimated to range between 7 foot and 13 feet. As described in Section 4.1, approximately 400 cubic yards of petroleum impacted soil were excavated and transported off-site during RAM and IRA activities conducted in August 2008.

Soil data obtained from 16 soil samples are available to characterize current Site conditions: five (5) confirmatory soil samples (Bottom, East Side Wall, South Side Wall, West Sidewall, and North Side Wall) collected from the main excavation area; four (4) confirmatory soil samples (UST-Bottom, UST-SW South, UST-SW North, and UST-SW West) collected from the UST excavation area; and seven soil samples (MW-1, AE-101 (6-8'), AE-101 (8-10'), AE-106, AE-108, AE-202, and AE-607) collected by previous consultants outside of the excavation area prior to excavation activities. All soil samples were submitted for analysis of VPH and EPH, both with target analytes. Additionally, AE-101 (8-10') was analyzed for volatile organic compounds, none of which were detected. It should also be noted that no VPH or EPH constituents were detected in the soil sample AE-101 (6-8'), and that no analyzed constituents were detected in soil sample AE-203.

EPH fractions were those constituents detected with the highest frequency and concentrations. EPH concentrations were highest within two soil samples collected prior to excavation activities and outside of the excavation area (MW-1 and AE-607, both of which are located along the southern portion of the Site). All three EPH fractions were detected in these two samples with concentrations ranging from 170 mg/kg of C9-C19 aliphatics in MW-1 to 652 mg/kg of C19-C36 aliphatics in AE-607. C11-C22 aromatic hydrocarbons and C19-C36 aliphatic hydrocarbons were also detected in all nine confirmatory soil samples, with the highest concentrations (749 and 476 mg/kg, respectively) observed within the soil sample collected from the bottom of the main excavation area. C9-C18 aliphatic hydrocarbons were detected in seven confirmatory soil samples, again with the highest concentration (505 mg/kg) found in the bottom of the main excavation. C11-C22 aromatics were detected in AE-202 and C19-C36 aliphatics were detected in AE-101 and AE-202, both of which were detected at much lower concentrations than the other soil samples.

A total of 15 PAHs were detected in soil, in both confirmatory samples and those collected outside of the excavation area. The locations of the highest concentrations of PAHs were scattered across the various samples, although PAHs were detected most frequently in soil samples AE-202, UST-Bottom, and UST-SW South. Of these, PAHs classified as carcinogenic (benzo[a]anthracene, benzo[a]pyrene, benzo[b]fluoranthene, benzo[k]fluoranthene, chrysene, and indeno(1,2,3-cd)pyrene) were detected in only two confirmatory soil samples (UST-SW-South and UST-Bottom) and one sample located outside of the excavation area (AE-202). Concentrations of PAHs were relatively low relative to EPH fractions. Additionally, the maximum detected concentrations of several PAHs including anthracene, benzo[a]anthracene, benzo[a]pyrene, benzo[b]fluoranthene, benzo[g,h,i]fluoranthene, benzo[k]fluoranthene, chrysene, fluoranthene, indeno[1,2,3-cd]pyrene, phenanthrene, and pyrene were below applicable MassDEP background values for natural soil, as shown on Table 2 of the Risk Characteriztion (provided in Appendix E).

A total of four VPH constituents were detected in Site soils: C5-C8 and C9-C12 aliphatics, C9-C10 aromatics, and m/p-xylenes. In general, VPH constituents were detected at lower concentrations relative to EPH fractions. 5-C8 aliphatics and m/p-xylenes were only detected one time at very low concentrations within AE-108 and MW-1, respectively. C9-C10 aromatics and C9-C12 were each detected in seven soil samples, the highest concentrations of which were found within MW-1 and the sample collected from the bottom of the main excavation area.

5.2.2 Groundwater

Groundwater data were collected during three separate sampling events conducted at the Property in November 2008, April 2009, and July 2009. A total of 20 groundwater samples were collected from the eight monitoring wells

sampled across the Property (WC-1 through WC-4, MW-4, B-6, AE-202, and AE-203) and were analyzed for VPH and EPH, both with target analytes. Only groundwater samples collected from WC-1 and WC-3 exhibited detected levels of certain analyzed constituents. No analyzed constituents were detected in groundwater samples collected from the other five monitoring wells located within the Site boundary (WC-2, WC-4, MW-4, B-6, and AE-202). No analyzed constituents were detected within monitoring well AE-203 during any of the three sampling events.

Only three constituents (C9-C10 aromatics, C11-C22 aromatics, and C19-C36 aliphatics) were detected in groundwater samples collected from WC-1, which is located along the southern portion of the Site. Groundwater samples collected from monitoring well WC-3 (located along the northern portion of the courtyard) exhibited the highest frequency of detection and the highest detectable concentrations of VPH and EPH constituents among the three Site monitoring wells. The following constituents were detected in groundwater samples collected from this monitoring location during at least one of the three monitoring events: C9-C10 aromatic hydrocarbons, C9-C12 aliphatic hydrocarbons, benzene, ethylbenzene, o- and m/p-xylenes, C11-C22 aromatic hydrocarbons, 2-methylnaphthalene, naphthalene, aceanaphthene, and fluorene. VPH and EPH hydrocarbon fractions (C9-C10 aromatics, C9-C12 aliphatics, C11-C22 aromatics, and C19-C36 aliphatics) were those constituents that exhibited the highest detected concentrations in Site groundwater (180, 130, 213, and 210 mg/L, respectively). The remaining EPH and VPH constituents that were detected in groundwater exhibited much lower concentrations than hydrocarbon fractions.

5.2.3 Indoor Air

Four indoor air samples were collected from the Site building in August 2009, which represent current indoor air conditions at the Site: IA-102 (collected from the fitness center), IA-103 (collected from the day care), IA-104 (collected from the crawl space beneath the day care), and IA-105 (collected from the lobby area of the F-Building). Although one indoor air sample (IA-101) was collected from the tenant space occupied by the day care facility in June 2009, this sample was concluded to be unrepresentative of current Site conditions, as described in Section 4.9, above. Therefore, W&C did not consider analytical data obtained from this indoor air sample for use in the risk characterization.

Indoor air samples were submitted for laboratory analysis of air phase hydrocarbons (APH) via MassDEP APH methodology. Only three constituents were detected in indoor air: C5-C8 aliphatic hydrocarbons, C9-C12 aliphatic hydrocarbons, and toluene. The maximum detected concentrations of C5-C8 aliphatics, C9-C12 aliphatics, and toluene (227, 98.8, and 14.6 ug/m^3, respectively) were all found in the indoor air sample collected from the fitness center (IA-102). These three constituents were also detected in the remaining three indoor air samples at slightly lower concentrations, especially for the sample collected from the crawl space beneath the day care facility (IA-104).

5.3 CONCEPTUAL SITE MODEL AND DISPOSAL SITE BOUNDARY

Petroleum impacts at the Site are the result of one (1) leaking 6,000-gallon fuel oil UST removed from the Site in 1989 and one (1) leaking 3,000-gallon fuel oil UST removed in 2008 as discussed in Sections 3.0 and 4.0. The UST releases resulted in petroleum impacts to sandy fill soils within the courtyard area of the Property at depths between approximately 8 and 13 ft bgs. Petroleum saturated soils were observed in several areas of the Site during excavation activities, particularly within the area of the 3,000-gallon fuel oil UST. In August 2008, the 3,000-gallon UST and approximately 400 cubic yards of petroleum-impacts soils were removed from the Site under a combined RAM and IRA. Soil excavation was guided by the visual presence of petroleum-impacted soils and/or headspace screening results. All observed grossly contaminated soils were excavated and removed off-site. The excavation area included the entire courtyard and was extended to within approximately ten lateral feet of the building footprint along the northern, western, and southern side of the courtyard. Soil excavation continued until no pooled or seeping NAPL was observed within subsurface soils or until excavation was impeded by the presence of surrounding

structures and/or the influx of groundwater into the excavation. Prior to backfilling this portion of the Site, it was noted that some residual NAPL remained along the northern wall within the northwestern corner of the main excavation area. However, the presence of the building impeded further excavation of soil within this area.

Results of confirmatory soil sampling following excavation activities indicate that concentrations of EPH and VPH in Site soils have decreased substantially as a result of soil excavation. Additionally, groundwater samples obtained during three separate sampling events indicate that Site groundwater has been minimally impacted by the release and confirmed that remedial activities were successful in removing the source (i.e., the leaking UST and petroleum-impacted soils). However, residual levels (approximately 0.01 feet) of measurable NAPL remain within the northwestern corner of the courtyard, in the vicinity where complete excavation of visually impacted soils could not be achieved due to the presence of the building. NAPL gauging conducted between November 2008 and June 2009 indicates that NAPL thickness within this well has achieved steady state and is not increasing. The NAPL thickness at this location has remained steady at 0.01 feet. Information gathered from the various gauging events conducted at the Site between November 2008 and June 2009 has also confirmed that the extent of the NAPL observed was limited in area. Therefore, it is concluded that although some residual NAPL remains, the majority of grossly impacted soils that constituted source material were removed and that NAPL thickness will decrease over time due to natural attenuation processes.

Soil data collected following excavation activities in August 2008, groundwater data collected in November 2008, April 2009, and July 2009, soil gas data collected in April 2009, and indoor air data collected in August 2009 were the data considered most representative of current Site conditions and were relied upon to define the Disposal Site boundary. Older soil data collected prior to excavation activities (in December 1997, September and October 2004 and January 2005) outside of the excavation area were also conservatively considered representative of current conditions. Based on the available Site data and observations made in the field, the Disposal Site extends from a portion of the C-Building, encompasses the entire courtyard area, includes the A- and F-Buildings, and continues to the edge of the Property along Canton Street. The Disposal Site boundary is depicted in Figure 2.

The defined boundary of the Disposal Site is considered to be very conservative, as several of the data points included within the Site exhibit no to very little impacts, such as the soil data included from AE-202 (located along the eastern corner of the Site, adjacent to Canton Street), as well as MW-4 and AE-101 (both located within the fitness center in the C-Building). Inclusion of a portion of the C-Building within the Site boundary is especially conservative since soil and groundwater data obtained from this area indicate very little impact and the indoor air sample (IA-102) collected from this tenant space is considered representative of background conditions, as discussed in Section 4.9. Additionally, groundwater samples collected from monitoring wells WC-4 and B-6 in July 2009 did not contain detectable concentrations of analyzed constituents; however, since these two locations were only sampled once and are located in close proximity to the Site buildings, they were conservatively included within the Disposal Site boundary. It should be noted that the monitoring location AE-203 (located just east of the courtyard entrance) was excluded from the Site boundary since soil and groundwater data collected from this location did not contain detectable concentrations of analyzed constituents.

The potential for adverse exposures resulting from the Site to future trespassers, current and future day care participants and facility workers, current utility workers, and future construction/utility workers are discussed in further detail in the Method 3 Risk Characterization included in Appendix E. This Risk Characterization indicates that a Condition of No Significant Risk has been achieved at the Site under current and certain future Site conditions and relied upon implementation of an AUL prohibiting future residential and institutional use of the Site. Additional response actions will not be required and a permanent solution has been achieved.

6. MCP REPRESENTATIVENESS EVALUATION AND DATA USABILITY ASSESSMENT

A comprehensive data quality review was performed to confirm that the appropriate Response Action Performance Standards (RAPs) have been achieved with respect to data quality and use in accordance with 310 CMR 40.0191(2)(c). The data quality review included both a Representativeness Evaluation and a Data Usability Assessment (REDUA) as summarized below. The data quality review was performed in consideration of MassDEP's Quality Assurance and Quality Control Guidelines for the Acquisition and Reporting of Analytical Data in Support of Response Actions Conducted Under the MCP (WSC-CAM-VII A) (MassDEP 2004b), as well as MassDEP's MCP Representativeness Evaluations and Data Usability Assessments (REDUA) Policy (#WSC-07-350) (MassDEP 2007c).

As part of this process, quality assurance indicators were utilized in order evaluate sample collection and measurement error. These indicators have been examined in the context of the intended use of the data, and an overall assessment of the data for rendering a waste site cleanup opinion. The LSP opinion of data quality and usability was rendered relative to an evaluation of current understanding of the nature and extent of the release at the Disposal Site, and the potential migration of contaminants within the subsurface attributable to the Disposal Site.

Approximately 400 cubic yards of petroleum-impacted soils were excavated from the Site in August 2008. Confirmatory soil sampling was conducted following completion of RAM and IRA activities. Only soil data collected within the courtyard area following excavation activities and soil data collected outside of the excavation areas prior to remediation activities (i.e., are still present at the Site) were used in the Method 3 Risk Characterization. Additionally, data obtained from three rounds of groundwater sampling, one round of soil gas sampling, and two rounds of indoor air sampling are considered to be reflective of post-excavation conditions and were, therefore, used in the decision making process for the Method 3 RC and Class A-3 RAO. Therefore, older soil data collected from the excavation area and all groundwater data collected prior to remediation that were not used in the Method 3 Risk Characterization have also been excluded from the REDUA.

The REDUA focuses on data obtained from the following environmental samples:

- Two soil samples (AE-101 [6-8'] and AE-101 [8-10']) collected in September 2004;
- Two soil samples (AE-106 and AE-108) collected in October 2004;
- One soil sample (AE-202) collected in January 2005;
- One soil sample (AE-607) collected in September 2006;
- Nine confirmatory soil samples (Bottom, East Side Wall, West Side Wall, North Side Wall, South Side Wall, UST-SW West, UST-SW-North, UST-SW-South, UST-Bottom) collected in August 2008;
- Six groundwater samples (WC-1, WC-2, WC-3, MW-4, AE-202, and AE-203), one field duplicate groundwater sample (WC-101), and one trip blank sample collected in November 2008;
- Six groundwater samples (WC-1, WC-2, WC-3, MW-4, AE-202, and AE-203) and one trip blank sample collected in April 2009;
- Three soil gas samples (SG-1, SG-2, and SG-3) collected in April 2009;
- One ambient air sample (Ambient) collected in April 2009;
- One indoor air sample (IA-101) collected in June 2009;
- One ambient air sample (AA-101) collected in June 2009;
- Eight groundwater samples (WC-1, WC-2, WC-3, WC-4, MW-4, AE-202, AE-203, and B-6) collected in July 2009; and,
- Four indoor air samples (IA-102, IA-103, IA-104, and IA-105) collected in August 2009.

It should be noted that although data obtained from indoor air, ambient air, and NAPL samples collected from the Site in June 2009 and analyzed for EPA Methods TO-15 (Modified), EPH Method 8015 (Modified), and/or EPA Method 8260 (Modified) were used for project making decisions, the quality of these data were previously reviewed by New Fields (New Fields 2009), a discussion of which is provided in the New Fields report provided in Appendix F. According to the New Fields report, these data were found to be "accurate and traceable and met laboratory established method data quality objectives." Additionally, although data from one soil sample (MW-1) collected from the Site outside of the excavation area in September 2006 was used in the Class A-3 and Method 3 RC, analytical laboratory reports for soil sample MW-1 were unavailable; therefore these data were not included in the REDUA.

6.1 REPRESENTATIVENESS EVALUATION

The Representativeness Evaluation is an evaluation and demonstration of the adequacy of the spatial and temporal data sets used to support the decisions in this Class A-3 RAO, including the appended Method 3 risk characterization. Per MassDEP guidance (MassDEP 2007a), the elements of the Representativeness Evaluation are presented in the following sections.

6.1.1 Conceptual Site Model

A full discussion of the Conceptual Site Model is included in Section 5.3.

6.1.2 Use of Field Screening Data

Field screening in the form of headspace screening and visual observation was used to assist in evaluation of the presence and relative magnitude of petroleum hydrocarbons present in Site soils during Site investigation and remedial activities. The objective of soil excavation activities was to remove petroleum-impacted soils that were resulting in measurable NAPL thickness above the UCL criterion of ½-inch, as well as potentially acting as a continuing source of contamination to groundwater beneath the Site. During remedial activities, jar headspace screening for total organic vapors (TOVs) with a photoionization detector (PID) and visual identification of petroleum-containing soils (specifically pooled and/or seeping NAPL) were used to guide the excavation process in both vertical and lateral directions. Excavation of each area continued until soils no longer appeared visually impacted or until further excavation was impeded by the presence of surrounding structures and/or the influx of groundwater into the excavation. Headspace data was also used to assist in selection of samples for laboratory analysis and as a secondary indicator of the absence or presence of VOC impacts at a particular sample location.

Prior to back-filling each excavation area, the majority of impacted soil was removed (as feasible) and headspace screening was conducted to confirm the visual observations made during remediation activities. Headspace readings measured in the field ranged from 0 to 67.9 parts per million by volume (ppmV), indicating that relatively low concentrations of volatile petroleum hydrocarbons were present in post-excavation soils. Field screening results correlate well with subsequent post-remediation confirmatory and groundwater analytical results, which show relatively lower concentrations of petroleum hydrocarbons compared with pre-remediation results. Additionally, post-remediation monitoring shows that the excavation activities were relatively successful in eliminating the source of separate-phase NAPL at the Site. Only one location in the Site continues to have measurable NAPL (WC-3), however the measured thickness (0.01 feet) in this monitoring location is below the ½-inch UCL criteria.

6.1.3 Sampling Rationale

As discussed in Section 5.3, petroleum impacts at the Site are the result of two leaking fuel oil USTs that were formerly located at the Site. Soil and groundwater data collected prior to remedial activities indicate that concentrations of one or more EPH constituents in excess of Method 1 standards were formerly present at the Site.

Additionally, NAPL with a thickness greater than the ½-inch UCL criteria was observed at several locations at the Site. As such, soil excavation activities were conducted in August 2008 to remove impacted soil and groundwater at the Site. Following soil remediation, confirmatory soil samples were collected from the base and sidewalls of two excavation areas completed at the Site to confirm that remedial goals had been achieved. Additionally, groundwater, soil gas, ambient and indoor air sampling was conducted following excavation activities to document post-remediation conditions at the Site.

As described in Section 4.3, confirmatory soil samples were collected throughout the course of RAM and IRA activities prior to back filling each excavation area in with unimpacted material and clean fill. Numerous grab samples were composited into representative samples reflecting the bottom and sidewalls of the main excavation area conducted under the RAM, as well as the 3,000-gallon UST excavation area conducted under the IRA. Visual observations and jar headspace screening were used to aid in the selection of soil samples within the excavation areas. In general, soil samples were collected from the 5 to 13 foot depth interval, which coincides with the general depth of the petroleum impacted soil across the Site and the depth of the excavated 3,000-gallon fuel oil UST. Confirmatory soil samples were analyzed for VPH and EPH, both with target analytes. Given the size of the excavated areas (with a combined area of approximately 4,800 square feet) and the type of release (i.e., petroleum), the number, location, and analytical methods are appropriate to characterize current soil conditions at the Site.

Following remediation, three monitoring wells were installed at the Site to replace several wells that were destroyed during excavation activities. The monitoring wells were installed to an approximate depth of 13 to 19 ft bgs and were screened across the water table. Groundwater samples were collected from both on-Site wells and wells located on the Property but outside the Disposal Site boundary during three separate sampling events (November 2008, April 2009, and July 2009) to document post-excavation conditions. Groundwater samples were analyzed for VPH and EPH, both with target analytes. Given the location of the monitoring wells relative to the excavation areas and the former USTs that served as a source of release at the Site, the number, location, and analytical methods are adequate to characterize current groundwater conditions at the Site and across the 2 Canton Street property.

In April 2009, three permanent soil gas probes were installed at the Site and one soil gas sample was collected from each sampling point to evaluate if a complete vapor intrusion pathway from the subsurface to the indoor air of the overlying structure exists. Soil gas samples were collected in areas proximate to the three Site monitoring wells and within ten feet laterally of the Site building and were submitted for analysis of APH. Given the size of the Disposal Site relative to the Site buildings, the number and location of the soil gas samples are adequate to evaluate vapor conditions across the Site.

To further assess if vapor migration from the subsurface to indoor air within the building is occurring, indoor air samples were collected within the Site building from five different locations in June and August 2009. The locations of the indoor air samples were selected based on proximity to the release areas, as well as the current use within proximity of each sampling location (i.e., occupied office/retail space, day care, etc.). Given the configuration of the Site buildings (which consist of four interconnected structures) and the square footage of each area sampled, the number and location of indoor air sampling is appropriate to assess the potential for vapor intrusion within the building. Although the indoor air sampling was only conducted once during the warmer summer months (and therefore may not capture seasonal fluctuation), indoor air conditions within the Site building are not anticipated to change significantly between the summer and winter due to the nature of the heating and cooling systems within the buildings. The portion of the Site building where the majority of indoor air samples were collected is situated over a portion of the Disposal Site (and in close proximity to residual NAPL present within WC-3) is heated and cooled through the use of central air conditioning and is negatively pressurized. Therefore, the windows within this portion of the building remain closed year round, thereby reducing the amount of dilution that may occur. Ambient air sampling was also conducted in conjunction with the soil gas and indoor air sampling to rule out potential interference contributed by outside sources (i.e., vehicle exhaust, use of gasoline powered lawn mowers, etc.). All ambient and

indoor air samples were analyzed for APH. The ambient and indoor air samples collected in June 2009 was also analyzed for Modified TO-15 (which quantifies PIANO volatiles) in support of forensic paneling, as described in Section 4.12

6.1.4 Number, Spatial Distribution, and Handling of Samples

With respect to the spatial distribution, sample locations were selected based on the relative location of observed release areas. The number and location of samples were sufficient to define the nature and extent of OHM impacts in groundwater as discussed in Sections 4 and 5.

All samples were handled, stored, and transported in accordance with the requirements of the specific method requirements, according to lab reports and field notes.

6.1.5 Temporal Distribution of Samples

The petroleum impacts at the Site are attributed to two leaking USTs formerly located at the Site. Given that these USTs and the majority of impacted soils have been removed, it is likely that release conditions have been mitigated.

Multiple rounds of post-remediation groundwater sampling and NAPL monitoring were conducted to sufficiently define the nature and extent of petroleum contamination and to document trends in groundwater elevation and NAPL thickness. Although oil-saturated soils were formerly contributing to the occurrence of LNAPL above UCLs (W&C, 2008c), groundwater monitoring showed that the LNAPL was relatively immobile (W&C, 2008a) as evidenced by the relatively low concentrations of analyzed constituents within groundwater both before and after excavation. This observation, coupled with the fact that source area soils have been removed from the Site, residual NAPL at the Site is less than the UCL criteria, and that NAPL has not been observed within any other Site monitoring wells, suggest the analytical data presented in the appended Method 3 Risk Characterization are representative of current Site conditions.

Although available, groundwater data collected from the Site prior to excavation activities are no longer representative of current Site conditions and were therefore excluded from the Method 3 Risk Characterization, this Class A-3 RAO, and the REDUA.

Indoor air sampling was conducted in June and August 2009. Although seasonal fluctuation in indoor air conditions may not be adequately reflected through the results of the summer 2009 sampling, significant changes in indoor air conditions are not anticipated given that the portion of the Site building overlying the Disposal Site is heated and cooled via central air conditioning, thereby reducing the amount of dilution that may occur through ventilation.

6.1.6 Completeness

No data gaps have been identified to date. All collected samples were analyzed as planned and sampling locations are appropriately distributed across the Site. The results of field screening coupled with analytical data in support of this evaluation indicate that a continuing source of environmental contamination does not exist. Confirmatory soil sampling, multiple rounds of groundwater sampling, soil gas sampling, and indoor air sampling were all conducted following excavation activities to sufficiently define the nature and extent of contamination and to establish contaminant trends over time.

As previously mentioned in Section 6.1.3, indoor air samples were also collected to assess potential impacts from the Site to indoor air quality. Therefore, no data gaps were identified during the Representativeness Evaluation.

6.1.7 Inconsistency and Uncertainty

All of the contaminants detected in soil and groundwater at the Site are consistent with the release of fuel oil from the former 6,000-gallon and 3,000-gallon fuel oil USTs.

Soil data collected from the courtyard area and all groundwater data collected at the Site prior to the August 2008 remediation activates were excluded from the REDUA as these data are no longer considered representative of current Site conditions. Although exclusion of these data may contribute some uncertainty to the RAO, soil concentrations have dropped significantly since completion of soil excavation activities and it is likely that soil data adequately reflect current Site conditions. Additionally, groundwater data indicate that groundwater beneath the Site has been minimally impacted by the release. Therefore, it is likely that Disposal Site conditions are stable and/or decreasing over time. All data collected to date are consistent with the current Conceptual Site Model.

As previously mentioned in Section 4.9, constituent concentrations within the indoor air sample collected from the Site in June 2009 (IA-101) were more than double those observed in indoor air samples collected from the Site in August 2009. Additionally, information collected following collection of the June 2009 indicated that background interference likely attributed to the observed concentrations within the air sample. Therefore, IA-101 was concluded to be uncharacteristic of actual Site conditions and was therefore excluded from use in the risk characterization.

Additional indoor air samples were collected in August 2009 and were analyzed for APH and VOCs, which is judged appropriate based on the release history. As with all indoor air sampling, there is an inherent amount of uncertainty regarding the representativeness of the indoor air samples with regard to indoor air concentrations related to the Disposal Site versus background sources (e.g., occupant activities, building materials). Exclusion of the June 2009 indoor air data from the risk characterization adds some uncertainty to the assessment. However, given that suspected interferences were identified and corrected prior to the August 2009 indoor air sampling, it is likely that the June 2009 data are anomalous and that the August 2009 data are more representative of actual Site conditions.

6.1.8 Information Considered Unrepresentative

Information considered unrepresentative of Site conditions is discussed in Section 6.1.7 above.

6.2 DATA USABILITY ASSESSMENT

The purpose of the data usability assessment is to evaluate the quality of the dataset and to determine its usability in a representativeness evaluation. A data usability assessment includes a field component and an analytical component. The field component evaluates the sampling method, sample preservation, sample handling and holding times to establish compliance with the applicable methods and protocols and thereby confirm that the samples analyzed at the laboratory are representative of the sampling point. The analytical data usability assessment is used to evaluate whether the analytical data points are scientifically valid and defensible and of a sufficient level of precision, accuracy, and sensitivity to be used in the representativeness evaluation.

6.2.1 Analytical Data Usability Assessment

The Analytical Data Usability Assessment is intended to evaluate whether analytical data points are scientifically valid and defensible, and of a sufficient level of precision, accuracy, and sensitivity to:

- Delineate the Disposal Site boundary;
- Adequately characterize risk;
- Demonstrate elimination/control of uncontrolled sources;
- Demonstrate achievement of background, to the extent feasible; and,
- Demonstrate achievement of a condition of No Significant Risk at the Disposal Site.

An analytical data usability assessment was performed for all laboratory data collected for decision making for this Class A-3 RAO, with the exception of soil sample MW-1, for which laboratory analytical reports were not available. For the purposes of this REDUA, only data generally reflective of current Site conditions are included in the data usability assessment, including soil data collected outside of the excavation area in December 1997, September and October 2004, January 2005, February 2006, and confirmatory soil data collected within the excavation area in August 2008; groundwater data collected in November 2008, April 2009, and July 2009; soil gas data collected in April 2009; oil data collected in June 2009; and indoor air data collected in June and August 2009. Please note that although indoor air data collected from IA-101 in June 2009 are not considered representative of Site conditions, data from this sample was included in the analytical data usability assessment since it was used for project decision making.

6.2.1.1 Evaluation for CAM Compliant Data

The first step in the analytical data usability assessment was to review each data set to determine whether the data achieved Presumptive Certainty as defined in WSC-CAM-VII A. Data that meet Presumptive Certainty criteria are also referred to as "CAM Compliant" data. CAM Compliant means that an analytical result: (1) was determined using an MCP Analytical Method detailed in the CAM; (2) complies with the method-specific QC analytical requirements specified in the CAM; (3) includes an evaluation of the compliance with method-specific performance standards with deficiencies narrated, as necessary; and (4) was reported in the format specified in the CAM for MCP analytical data.

The report format specified in the CAM requires the analytical laboratory to provide an Analytical Report Certification for each set of samples submitted for analysis. The Certification requires the laboratory to answer the following questions:

A. Were all the samples received by the laboratory in a condition consistent with those described on their Chain-of-Custody documentation for the data set?

B. Were all QA/QC procedures required for the specified analytical method(s) included in this report followed, including the requirement to note and discuss in a narrative QC data that did not meet appropriate performance standards or guidelines?

C. Does the analytical data included in this report meet all the requirements for "Presumptive Certainty," as described in Section 2.0 of the MassDEP document CAM VII A, "Quality Assurance and Quality Control Guidelines for the Acquisition and Reporting of Analytical Data"?

D. Was the VPH or EPH method run without significant modifications, as specified in Section 11.3?

E. Were all QC performance standards and recommendations for the specified analytical method(s) achieved?

F. Were results for all analyte-list compounds/elements for the specified method(s) reported?

An affirmative response to questions A, B, C & D and a response to questions E & F is required for Presumptive Certainty Status. Each of the Analytical Report Certifications was reviewed for compliance with the Presumptive Certainty requirements. This Class A-3 RAO includes CAM Compliant Data contained within the following analytical reports:

Soil:	Geo Labs, Inc. reports 115156-115157, 156086-156095, 160169-160172, and 602215; and Alpha Analytical Laboratories laboratory report L0812877; and
Groundwater:	Resource Laboratories, LLC report 15678 and Alpha Analytical Laboratory reports L0904740 and L0908955.

Analytical data for soil gas, indoor air, and ambient air samples are not included in CAM methods and are therefore considered "non-CAM" data. Additionally, the laboratory analytical report containing data for soil sample AE-607 did not meet CAM criteria as the case narrative was missing and therefore these data are considered CAM-Non compliant. Accordingly, air data and soil data for AE-607 are discussed separately from CAM Compliant Data in Section 6.2.1.2.

The remaining data are considered CAM Compliant and are discussed further below. Lab reports containing data collected by W&C are included in Appendix B. Soil data collected between September 2004 and February 2006 were previously submitted to MassDEP and, therefore, associated laboratory analytical reports for these data not presented herein. A summary of all the samples used in the Class A-3 RAO and included in the REDUA is presented on Table 8, which also presents specific information for each data package included in the REDUA, including whether or not qualifications were applied to the data.

Review of the Analytical Report Certifications for each lab deliverable indicated that with the exception of soil samples contained within Lab Report L0812877, each of the aforementioned data sets meet Presumptive Certainty Requirements. As indicated by a negative response to Question C, soil data for one soil sample ("South Side Wall") collected in August 2008 and contained within Lab Report L0812877 did not meet Presumptive Certainty requirements due to its submission for laboratory analysis of VPH without adequate methanol preservative. However, this deficiency was noted immediately following sample receipt at the laboratory and the soil sample was appropriately preserved for VPH analysis. Although some volatile analytes may have been lost between the time the sample was collected and when it was preserved at the laboratory, it was determined this potential low bias would not render the data as unusable. Additionally for VPH analysis, eight of the nine soil samples included within the lab packet did not meet the recommended methanol to soil due to insufficient soil in the vials. As a result, the detection limits would be relatively elevated; however, the sample results should be otherwise unbiased. In all cases, the methanol was completely covering the soil. To be conservative, all sample results are considered to be estimated; detected values in affected samples were qualified with a J and non-detected results were qualified with a UJ It should be noted that the VPH method requires additional methanol (up to 2 milliliters of methanol per gram of soil) in the case of highly organic matrices.

Questions A through D were answered affirmatively for all remaining data contained within the aforementioned lab reports. However, certain QC performance standards (Question E) were not met for some of these data sets, thereby requiring a review of the QC performance for individual samples or data sets to assess the usability of the data in question. Additionally, results for all analyte-list compounds for the specified methods were not reported (Question F). Therefore, the results of the analytical data usability assessment for affected data are summarized by data packet below.

August 2008 Soil Samples (Lab Report L0812877): For VPH analysis, the surrogate recoveries for the soil sample identified as "UST-SW South" were outside of acceptance criteria. However, re-analysis was not required since the sample was non-detect for all target analytes. Thus, no qualifications were applied to the data. For EPH analysis, the laboratory control sample (LCS)/LCS duplicate (LCSD) relative percent difference (RPD) associated with soil sample "West Side Wall" were above acceptance criteria for several constituents. However, the individual LCS/LCSD recoveries were within method limits. Thus, no qualifications were applied to the data.

November 2008 Groundwater Samples (Lab Report 15678): For VPH analysis, surrogate recoveries for groundwater sample identified as "WC-2" were below acceptance criteria due to matrix interference. Re-analysis showed similar results. As such, some volatile analytes may have been lost during analysis. However, no analytes were detected. All non-detected results were qualified as estimated ("UJ"). This finding was determined not to sufficiently bias any data points such that they would be rendered unusable.

April 2009 Groundwater Samples (Lab Report L0904740): VPH results for all samples within this data packet had LCSD recoveries below acceptance criteria for pentane. However, results for target carbon ranges and analytes were within method criteria and, therefore, no qualifiers were applied to the data.

July 2009 Groundwater Samples (Lab Report L0908955): For EPH analysis, LCS/LCSD RPD for all samples was above acceptance criteria for nonane. However, the individual LCS/LCSD recoveries are within method limits. Therefore, the data were accepted without qualification. No other QC issues were identified for this data packet.

6.2.1.2 Evaluation for CAM Non-Compliant, Non-CAM and Pre-CAM Data

All soil and groundwater data included within the REDUA are CAM Compliant with the exception of soil sample AE-607 for which the case narrative was missing from the lab report. Additionally, air data (i.e., soil gas, ambient air, and indoor air) and NAPL data are unable to achieve Presumptive Certainty as defined in MassDEP's REDUA policy (MassDEP 2007a). Instead, a traditional approach to assessment of precision, accuracy, and sensitivity was taken to evaluate these data. Each of these parameters is discussed below, with a summary of the selected assessment methods and measures. In summary, all air and NAPL data, and data collected from soil sample AE-607 were determined to be of acceptable precision, accuracy, and sensitivity that are useable for project discussions.

Non-CAM Data:

This RAO includes the following analytical reports for Non-CAM data:

Soil Gas: Alpha Analytical Laboratory report L0904776;

Indoor Air: Alpha Analytical Laboratory reports L0909849 and L0910717; and,

` Ambient Air: Alpha Analytical Laboratory reports L0904776 and L0909849;

Precision: Precision is a measure of mutual agreement among individual measurements, under prescribed conditions (i.e., random error). Precision may be evaluated qualitatively or quantitatively. Qualitative assessments of precision are based upon evaluations of larger data sets and will consider the range of concentrations encountered for a complete data set for a location or area. For this small air data set, precision was evaluated quantitatively.

Quantitatively, precision is generally expressed as the RPD between duplicate samples. Duplicates are two samples that are handled in an identical manner and the RPD of the measured results represents the precision (reproducibility) of the measurements. The laboratory performed duplicate analysis of select constituents for one air sample from each lab report (L0904776, L0909849, and L0910717). All constituents exhibited relatively low RPD results (i.e., <15%), indicating good precision with respect to the laboratory's preparation and/or analysis of samples.

Accuracy: Accuracy is the degree of agreement of a measurement with an accepted reference or true value. The difference between the measurement and the true value is usually expressed as a percentage or ratio. Accuracy is a measure of the bias that exists in a system. For the air dataset (including soil gas, indoor air and ambient air), the accuracy of the laboratory analytical procedures was measured through a review of laboratory control sample results (LCS; or blank spike). With one exception, the percent recoveries for each analyzed constituent within the lab control sample analysis were within the specified acceptable percent recovery limits (70-130%) for each laboratory report, indicating that no chemicals of interest were lost (resulting in a potential low bias in the data) or that chemical concentrations were not accurately quantitated (resulting in a potential high bias in the results). For EPH analyses contained within lab report L0904776 (for April 2009 soil gas samples), the LCS recovery for naphthalene was outside acceptance criteria. However, all associated results for naphthalene were non-detect and, therefore, data were accepted without qualification.

Sensitivity: Sensitivity is the ability of the method to detect the contaminant of concern at the concentration of interest, expressed as the Reporting Limit. Sensitivity was evaluated based on a review of the sample quantitation and reported quantitation limits. The review indicates the detection limits for each of the indoor samples were appropriately low (i.e., at or near 14 ug/m^3) for specified compounds.

Sensitivity was also evaluated based on a review of laboratory cross-contamination using method blank results. All constituents were non-detect within the method blank analyses provided within each applicable laboratory report.

CAM Non-Compliant Data:

Soil: GeoLabs, Inc. report 0602215

Quality control sheets from this laboratory report were unavailable; therefore, data usability of this sample was evaluated qualitatively based on a review of the analytical results from the lab report. Review of analytical data sheets for soil sample AE-607 indicate that surrogate recoveries were below acceptance criteria for 1-chlorooctadecane for analysis of EPH fractions. Therefore, all associated results for EPH fractions were qualified as estimated. Surrogates for the remaining analyzed constituents (i.e., PAHs) were within acceptable limits and were therefore accepted without qualification. Review of analytical data for this soil sample indicates that sufficiently low detection limits were achieved to support project making decisions. Based on the above, it was determined that data for this one sample are of sufficient quality to support the RAO.

6.2.1.3 Data Evaluation Criteria

For some soil samples, reporting limits for VPH and EPH analyses were elevated due to dilution. As a result, surrogate recoveries were not recovered for certain compounds within one soil sample (UST-SW-South). The elevated reporting limits are an unavoidable, but acceptable consequence enabling quantification of target analytes, which exceed the calibration range. A review of the affected samples indicates a sufficiently low detection limit was achieved to support decision making in the RAO.

6.2.2 Field Data Usability Assessment

A review of the applicable field quality control elements was performed for the samples collected by Woodard & Curran. Sample containers were packed on ice in coolers immediately after collection and labeling and were accompanied by complete chain-of-custody forms from the time of sample collection until laboratory delivery. All samples were received at the analytical laboratory on ice. Chemical preservation was appropriate for all samples. Contaminants were not detected in trip blanks.

Additionally, blind field duplicate samples were collected during two of the groundwater sampling events (November 2008 and April 2009) to evaluate field sampling procedures and analytical precision. Results of duplicate sampling indicate an acceptable level of precision as a result of both field sampling and laboratory procedures.

Based on the foregoing, Woodard and Curran concludes that field quality control requirements have been met and the samples analyzed are representative of the sample point location.

6.2.3 Rejection of Analytical Data as the Result of Gross Failure

No analytical data were rejected due to evidence of gross failure during any laboratory process.

6.3 CONCLUSIONS OF THE REDUA

All data used in support of this Class A-3 RAO Statement were reviewed to confirm that the appropriate Response Action Performance Standards (RAPS) have been achieved with respect to data quality and use in accordance with the MCP. This process included both a Representativeness Evaluation and Data Usability Assessment. Results of the data usability assessment indicate that all data generated in support of the Class A-3 RAO were of sufficient quality and of a sufficient level of precision, accuracy and completeness to support the RAO. Review of the data indicate that the soil, groundwater, indoor air, and surface water data meet the primary data quality objectives (DQOs) of the project, which were to provide data that would support decisions with respect to delineation of the disposal site boundaries, and the estimation of exposures point concentrations for various media at the Site and 2 Canton Street property. Additionally, results of the representative evaluation indicate that data collected at the Site are adequately representative of Disposal Site conditions and that the collected data are of comparable quality over the entire sampling period.

7. SUMMARY OF THE METHOD 3 RISK CHARACTERIZATION

A characterization of risk to human health, safety, public welfare, and the environment was completed for the Disposal Site located at 2 Canton Street in Stoughton, Massachusetts. This Method 3 Risk Characterization (Method 3 RC), included in full in Appendix E, has been prepared in support of this Class A-3 RAO Statement, in accordance with 310 CMR 40.1046(2). This risk characterization has been performed in accordance with procedures outlined in the Massachusetts Contingency Plan (MCP; 310 CMR 40.0900) and in a manner consistent with scientifically acceptable risk assessment practices established by MassDEP and United States Environmental Protection Agency (USEPA).

An Activity and Use Limitation (AUL) has been implemented for a portion of the Property containing the disposal site ("Portion of the Property") that restricts future uncontrolled residential or institutional use of the Site. For the purposes of this Method 3 RC, only those activities and uses of the Portion of the Property consistent with the AUL were evaluated. As previously described, an AUL is a legal instrument that defines certain land activities and uses that are consistent with maintaining a condition of No Significant Risk (NSR) at a disposal site. The specific permitted and prohibited uses associated with the proposed AUL are described in more detail in Section 1.3 of the Method 3 RC. In general, the AUL prohibits future use of the Site for residential or institutional purposes due to the presence of petroleum vapors within indoor air. A copy of implemented AUL is provided in Appendix G.

The results of the Method 3 RC indicate that a condition of NSR of harm to human health, public welfare, safety, and the environment has been achieved at the Site, assuming implementation of the aforementioned AUL, and that the Site is thus eligible for a Class A-3 RAO.

Soil, groundwater, and indoor air were each identified as a media of concern for the evaluation. Chemicals of potential concern (COPCs) identified in various media at the Site include petroleum hydrocarbons and related constituents (i.e., PAHs). Based on current and potential future use of Site, human health risks were quantified for the following scenarios:

- Trespasser: Although trespassers may currently access the Site Currently, there are no complete exposure pathways for trespassers under current Site conditions as Site soils are either paved or covered by the Site building(s). However, it was assumed that in the future, trespassers could come into contact with COPCs in surface (0-3 ft bgs) or subsurface soils (0-15 ft bgs) should currently covered soils be dislocated and brought to the surface. The trespasser receptor is assumed to be a youth, 6-19 years of age which captures the age range with the highest potential for exposure (younger children are assumed to be less likely present at the Site or present under adult supervision). Potential exposure pathways to soil COPCs include dermal contact with soil, incidental ingestion of soil, and inhalation of fugitive dust. The Property is connected to municipal water and it is therefore unlikely that a trespasser would come into direct contact with contaminated groundwater. Although visitors or customers may also be intermittently present at the Site, the trespasser scenario is assumed to be protective of other receptors that are anticipated to have a lower frequency or intensity of exposure to Site soils.
- Day Care Participant: A portion of the Site building is occupied by a children's day care facility. Therefore, child day care participants were evaluated for exposure to COPCs present in Site soil and indoor air. Under current Site conditions there are no complete exposure pathways for soil since Site soils are either covered by pavement or are located beneath the existing Site building. However, it was assumed that in the future, day care participants could come into contact with COPCs in surface (0-3 ft bgs) or subsurface soils (0-15 ft bgs), should currently covered soils be dislocated and brought to the surface. Potential exposure pathways to soil COPCs include dermal contact with soil, incidental ingestion of soil, and inhalation of fugitive dust. There is a potentially complete exposure pathway for indoor air under both current and future Site conditions and, therefore, current and future day care participants were evaluated for inhalation exposures to volatile

COPCs present in indoor air. The Property is connected to municipal water and it is therefore unlikely that a day care participant would come into direct contact with contaminated groundwater. To streamline the risk assessment, current and future exposures to indoor air and future exposure to Site soils were quantitatively evaluated in a combined current/future day care participant scenario. It should be noted that the risk characterization specifically evaluated day care workers who have a work shift of 11 hours per day (normal operating hours of the day care are 7am to 6pm). Since the length of a typical workday is usually 8 hours, estimated risks for the day care worker are assumed to be protective of other facility workers at the Site.

- Facility Worker: The Site is currently used for office and retail space, as well as for a day care facility, artist studios, and other commercial uses. Presently, all impacted soils are either covered by the existing buildings or by asphalt pavement. Therefore, under current conditions, the only complete exposure pathway for facility workers is the inhalation of COPCs that may be present within indoor air.

  In the future, it is possible that a facility worker may be exposed to COPCs in soil 0-15 ft bgs while installing or maintaining landscaping or while engaged in other outdoor activities involving direct contact with soil, assuming that soils may become exposed and displaced in the future. Potential routes of exposure may include dermal contact with and incidental ingestion of soil, and inhalation of fugitive dust. For convenience, a combined current/future facility worker scenario was assumed in which both soil and indoor air exposures were evaluated to reflect potential exposures under both current and future conditions. Routes of exposure evaluated for the current/future facility worker scenario include dermal contact with and incidental ingestion of soil, inhalation of fugitive dust, and inhalation of indoor air. The Property is connected to municipal water and it is therefore unlikely that a facility worker would come into direct contact with contaminated groundwater.

- Utility Worker: It was assumed that current utility workers may come into contact with impacted Site soils and groundwater or may inhale volatile COPCs that accumulate in ambient air of an excavation pit or trench during emergency repair or maintenance of existing utilities at the Site. Potential exposure pathways include dermal contact with and incidental ingestion of soils, inhalation and ingestion of fugitive dust, dermal contact with groundwater and inhalation of volatile COPCs in ambient air of an excavation pit or trench. Ingestion of groundwater was deemed unlikely to occur for this scenario; therefore, this exposure pathway was not evaluated for the utility worker scenario. The utility worker is assumed to be an adult over 18 years of age who may become exposed to impacted soils or groundwater across any portion of the Site.

- Construction Worker: It was assumed that future construction workers may come into contact with impacted Site soils and groundwater during future site redevelopment activities, or may inhale volatile COPCs that accumulate in ambient air of an excavation pit or trench. Potential exposure pathways therefore include dermal contact with and incidental ingestion of soils, inhalation and ingestion of fugitive dust, dermal contact with groundwater and inhalation of volatile COPCs in ambient air of an excavation pit or trench. As with the utility worker, it was assumed that ingestion of groundwater was unlikely to occur; therefore, this exposure pathway was not evaluated. The construction worker is assumed to be an adult over 18 years of age who may become exposed to impacted soils or groundwater across any portion of the Site.

The MCP indicates that a condition of No Significant Risk of harm to human health exists or has been achieved if:

- No Cumulative Receptor Cancer Risk is greater than a Cumulative Cancer Risk Limit of 1×10^{-5};
- No Cumulative Receptor Noncancer Risk is greater than a Cumulative Noncancer Risk Limit of 1.0; and,
- No EPC is greater than an applicable suitably analogous public health standard.

Cumulative receptor non-cancer risks were compared to one, the MCP Cumulative Non-cancer Risk Limit. The cumulative receptor cancer risks were compared to the MCP Cumulative Cancer Risk Limit, which is an ELCR equal

to one in one hundred thousand (1×10^{-5}). Human Health Risk Assessment calculations showed that cumulative cancer and non-cancer risk estimates for the potential current and/or future receptors evaluated are below MCP risk limits. Therefore, a condition of No Significant Risk to human health exists for current and future conditions for all evaluated receptors, assuming implementation of the aforementioned AUL restricting future residential and institutional use of the Site.

Based on observations made and information collected during environmental investigations of the Disposal Site, conditions at the Disposal Site do not pose a threat of physical harm or bodily injury to people. Furthermore, W&C did not identify release-related conditions that may pose a risk to public safety. Therefore, a condition of No Significant Risk of harm to safety has been achieved at the Disposal Site.

There is no adverse impact to the surrounding community from the Site. A comparison of Site EPCs to MCP UCLs (310 CMR 40.0995(5)) indicates that EPCs for both soil and groundwater are below UCLs. Therefore, a condition of No Significant Risk of harm to Public Welfare has been achieved at the Site.

There are currently no complete exposure pathways on-site for terrestrial receptors, and groundwater concentrations of COPCs are unlikely to result in ecologically significant surface water concentrations in the nearby surface water bodies. Therefore, a condition of No Significant Risk of harm to the environment has been achieved at the Disposal Site under current and future conditions.

8. CLASS A-3 RAO STATEMENT

This section describes the RAO category and Disposal Site boundaries. It also provides a demonstration that sources are eliminated or controlled and a condition of No Significant Risk exists. A copy of the Class A-3 RAO Statement Transmittal Form (BWSC-104) was included in the eDEP online filing and is presented in Appendix A.

8.1 RAO CATEGORY AND DISPOSAL SITE BOUNDARIES

This RAO Statement applies to the entire disposal site located along a portion of the 2 Canton Street property, as shown on Figure 2. As documented herein, a Class A-3 RAO is applicable to the Site because: 1) a Permanent Solution has been achieved; 2) the level of OHM in the environment has not been reduced to background; 3) a Notice of Activity and Use Limitation has been implemented to maintain a condition of No Significant Risk; and 4) OHM at the disposal site do not exceed an applicable UCL in soil or groundwater. A copy of the AUL implemented for the Portion of the Property is provided in Appendix G.

The disposal site boundary defined for MassDEP RTN 4-00875 was delineated during various environmental investigations conducted at the Site, as previously described in Sections 3 through 5. The approximate horizontal extent of the disposal site is shown on Figure 2. Within this area, the Disposal Site is situated at depths ranging from 5 to 13 ft bgs. A confining till layer that bounds the bottom of the Site is present at an approximate depth of 12 to 16 ft bgs.

8.2 DEMONSTRATION OF NO SIGNIFICANT RISK

Based upon the findings of the Method 3 Risk Characterization (as summarized in Section 7 and presented in full in Appendix E), a condition of No Significant Risk of harm to human health, safety, public welfare, or the environment can be demonstrated for current property use and for future restricted property use after implementation of an AUL.

8.3 DEMONSTRATION THAT SOURCES ARE ELIMINATED OR CONTROLLED

To achieve a Class A RAO, all continuing sources of OHM which are resulting or likely to result in an increase in concentrations of OHM in an environmental medium must be eliminated or controlled. Release conditions at the Site are attributable to the former use and storage of fuel oil within two known USTs at the property. All known USTs have been removed from the Site, as well as approximately 400 cubic yards of petroleum-impacted soils that were acting as a continuing source of subsurface contamination. Therefore, the primary release sources have been eliminated.

The results of confirmatory soil sampling conducted following completion of excavation activities indicate that soil excavations were effective in reducing the overall contaminant mass relative to pre-remedial conditions. This observation coupled with the results of post-remedial groundwater monitoring and sampling indicate that petroleum-impacted soils are no longer serving as a continuing source of OHM to other environmental media. Furthermore, groundwater concentrations are not anticipated to increase overtime or with distance from the Site, due to the natural subsurface attenuation and dilution processes that occur with groundwater migration, the absence of a continuing source of OHM to groundwater following remediation.

8.4 FEASIBILITY OF APPROACHING BACKGROUND

Excavation activities completed at the Site under the RAM and IRA included the removal of approximately 400 cubic yards of petroleum-impacted soils from multiple excavation areas within the disposal site boundary. These response actions resulted in a condition of No Significant Risk at the Site and have achieved a Permanent Solution. Thus, the minimum performance standards for response actions outcomes have been met. However, the response actions did

not result in the achievement of background conditions at the Site. With limited exceptions, most compounds remaining at the Site (petroleum constituents), would not exist in the environment absent the Site, the background levels for most compounds are considered non-detect. Pursuant to the MCP, this evaluation considers the feasibility of performing response action to be beyond the benefits associated with achieving a Permanent Solution, in order to achieve or approach background for these compounds. Separate feasibility evaluations were conducted for soil and groundwater and are presented in the following sections.

8.4.1 Soil

W&C asserts that Site conditions support the conclusion that achieving or approaching background is not feasible. In accordance with MassDEP's policy "Conducting Feasibility Evaluations Under the MCP" (Policy #WSC-04-160, July 16, 2004) (MassDEP, 2004c), remedial actions to achieve or approach background may be considered categorically infeasible (i.e., the incremental cost of conducting remedial action would be substantial and almost always disproportionate to the incremental benefit of risk reduction) if any one of four conditions are met (MassDEP, 2004b). At this Site, soil conditions are consistent with two of the four the categorical infeasibility criteria of the policy. First, comparison of the seven COPCs in soil (refer to Table 2 in Appendix E) to the list of degradable compounds listed in the policy indicate that at least two COPCs (acenapthene and naphthalene) are listed as degradable (non-persistent). It is categorically infeasible to achieve or approach background for degradable compounds in soil. The remaining five soil COPCs (including petroleum hydrocarbon fractions that are assumed to consist of, in part or whole, No. 6 fuel oil) are either listed as persistent or can be conservatively treated as persistent. However, as stated in Section 9.3.3 of the Policy, for sites at which there are multiple (co-located) contaminants where it has been determined to be infeasible to achieve or approach background for any one of the co-located contaminants then it is unnecessary to evaluate the feasibility of achieving or approaching background for the remaining co-located contaminants.

Second, as stated in Section 9.3.2.1 of the Policy, it is considered infeasible to achieve or approach background when any portion of remedial work requires excavation under the foundation of a building or other permanent structure such that the integrity of the structure would be impaired. As previously stated, complete excavation of petroleum-impacted soils could not be conducted within the northwestern corner of the courtyard due to the presence of the Site building. This is the only area of the Site were residual NAPL remains. Therefore, it is categorically infeasible to achieve or approach background for petroleum impacted soils within this portion of the Site.

In summary, site conditions indicate that it is categorically infeasible to achieve or approach background for COPCs in Site soils. Therefore, it is unnecessary to conduct a Site-specific feasibility evaluation for Site soils as described in the policy.

8.4.2 Groundwater

Similarly, it is infeasible to achieve or approach background for degradable compounds in groundwater. At this Site, groundwater conditions are consistent with the categorical infeasibility criteria of the policy. Comparison of the 12 COPCs for Site groundwater (refer to Table 4 in Appendix E) to the list of degradable compounds listed in the policy indicate that six COPCs are classified as degradable (non-persistent). It is categorically infeasible to achieve or approach background for degradable compounds in groundwater. The remaining 6 COPCs are either listed as persistent or can be conservatively treated as persistent (including petroleum hydrocarbon fractions that are assumed to consist of, in part or whole, No. 6 fuel oil). Background in groundwater shall be considered approached for persistent compounds in areas classified as GW-1, GW-2, or GW-3 if the concentrations of each persistent compound at each Exposure Point are at or below ½ the applicable Method 1 groundwater standards as specified in 310 CMR 40.0900. As presented in the Method 3 Risk Characterization, the groundwater affected by these persistent compounds is classified as GW-2/GW-3 under both current and future site conditions. Comparison of the maximum detected concentration for each COPC in groundwater to established Method 1 GW-2 and/or GW-3

standards (as shown on Table 3) indicates that the maximum concentrations are below ½ of the applicable standards, and therefore background has been approached for persistent compounds in groundwater. As such, it is unnecessary to conduct a Site-specific feasibility evaluation for Site groundwater as described in the policy.

8.4.3 Cost-Benefit Analysis

W&C asserts that Site conditions (both soil and groundwater) support the conclusion that achieving or approaching background is not feasible, as described in Sections 8.4.1 and 8.4.2 above. Nevertheless, W&C also conservatively conducted a "Benefit-Cost Evaluation" for the Site to further document that it is infeasible to achieve or approach background.

As specified within Section 9.3.3.4 of MassDEP guidance (MassDEP, 2004c), "it shall be considered feasible to conduct remedial actions to achieve background conditions if the additional costs to remediate beyond a NSR condition are equal to or less than 20 percent of the cost to remediate to NSR." Several remedial activities have taken place to achieve NSR at the Site, including extensive excavation and off-site disposal of petroleum-impacted soil and groundwater in August 2008. The approximate total cost to remediate the Site to a condition of NSR is $150,000. This estimate, which is conservative, is exclusive of remedial activities conducted prior to August 2008. Additional remedial actions conducted prior to August 2008 would only add to the total cost. All accessible petroleum-impacted soils and groundwater were excavated during RAM and IRA activities in August 2008. Only soils located beneath a portion of the Site building and those soils located beneath the water table remain. It is estimated that an additional $50,000 would be required to further remove these inaccessible soils and/or impacted groundwater, including disposal costs as well as costs associated with significant dewatering that would be required to access soils below the water table. The estimated incremental costs to achieve or approach background, therefore, results in a cost estimate greater than 20 percent of the cost to achieve NSR. Therefore, under 310 MCR 40.0860(5)(b), the likely costs of conducting further remediation are not justified by the foreseeable benefits of that cleanup effort and, therefore, a remedial action that would achieve or approach background is not feasible or practical.

8.5 RELATIONSHIP TO OTHER RESPONSE ACTION OUTCOMES

To date, three RTNs (4-00875, 4-18753, and 4-21470) have been assigned to release conditions occurring on the 2 Canton Street property. Descriptions of the release conditions and response actions completed are summarized in Sections 3.0 and 4.0 of this report.

This Class A-3 RAO Statement will complete response action requirements for RTN 4-00875. Since the remaining two RTNs (4-18753 and 4-21470) were linked to the Site's primary RTN 4-00875, RAO Statements are not required for these secondary RTNs. In addition, the IRA activities conducted in response to the release conditions associated with these two additional RTNs have been completed as documented in the IRA Completion Statements submitted on September 7, 2006 (for RTN 4-18753) and October 29, 2008 (for RTN 4-21470), so no further response actions are necessary on any portion of the disposal site to maintain a condition of No Significant Risk.

8.6 POST-CLOSURE OPERATION, MAINTENANCE, OR MONITORING

No operation, maintenance, or monitoring will be required to confirm or maintain those conditions at the Site upon which this RAO Statement is based. A Permanent Solution has been achieved for the Site under the criteria for a Class A-3 RAO Statement.

8.7 DEMONSTRATION OF A PERMANENT SOLUTION

A Permanent Solution, as defined in 310 CMR 40.0006, has been achieved for the Disposal Site located at 2 Canton Street, Stoughton, Massachusetts under the criteria for a Class A-3 RAO. The Class A-3 RAO is contingent on the maintenance of an Activity and Use Limitation for the Portion of the Property containing the Disposal Site, the details of which are presented in Appendix G.

8.8 LICENSED SITE PROFESSIONAL OPINION

It is the opinion of the Licensed Site Professional (LSP) of record, John A. Thompson, LSP (#3989), that based on the results from the environmental investigations performed and the findings of the Method 3 Risk Characterization, a Class A-3 RAO, as defined in 310 CMR 40.1046(2), applies to the disposal site located at 2 Canton Street, Stoughton, Massachusetts.

9. CONCLUSIONS

The Response Action Outcome (RAO) Statement presents the rationale for a Class A-3 RAO Statement for the disposal site assigned RTN 4-00875 and at 2 Canton Street, Stoughton, Massachusetts. The Site consists of land impacted by petroleum hydrocarbons and related constituents as a result of two leaking fuel oil underground storage tanks (USTs) that were formerly located at the Site. Petroleum-saturated soils resulting from the two leaking fuel oil USTs were acting as a continuing source of soil and groundwater contamination at the Site. In August 2008, approximately 400 cubic yards of petroleum-impacted soils in August 2008 under Release Abatement Measure (RAM) activities. Additionally, an unknown 3,000-gallon fuel oil UST that was discovered during RAM activities was also removed in August 2008 under Immediate Response Action (IRA) activities. Removal of the UST and petroleum-impacted soils from the Site has resulted in significantly reduced concentrations of petroleum hydrocarbons within soil and groundwater at the Site. While residual levels of petroleum hydrocarbons remain in soil, and to a lesser extent groundwater, LNAPL has not been measured at a thickness greater than the ½-inch Upper Concentration Limit (UCL) during post-remediation monitoring thereby indicating that the remedial goal has been met.

Results of a site-specific Method 3 Risk Characterization indicate that a condition of No Significant Risk to human, health, safety, public welfare, and the environment exists for current uses at the Site. However, to ensure that a level of No Significant Risk remains in place for future Site uses, a Notice of Activity and Use Limitation (AUL) has been implemented that ensures future Site use is consistent with the assumptions and restrictions of the Method 3 Risk Characterization.

The filing of a Class A-3 RAO Statement indicates that: 1) a Permanent Solution has been achieved; 2) the level of oil and/or hazardous material (OHM) in the environment has not been reduced to background; 3) a Notice of AUL is being implemented to maintain a level of No Significant Risk; and 4) OHM at the Site do no exceed an Upper Concentration Limit in soil or groundwater.

Notes:
Only soil data collected within the limits of the disposal site boundary are presented.
ft bgs = Feet below ground surface.
mg/kg = Milligrams per kilogram.
U = Not detected at presented laboratory reporting limit (LRL).
J = Estimated value.
"--" = Constituent not analyzed.
Bold font indicates that the constituent was detected above its LRL.
1. Data for this sample were transcribed from Tables 1 and 2 of the April 27, 2006 Immediate Response Action Status Report prepared by Avier Environmental, Inc.
2. This sample was also submitted for laboratory analysis of volatile organic compounds. However, since no a analyzed constituents were detected, the results are not presented.
3. The maximum detected concentration and the minimum LRL (for non-detects) between EPH and VPH analyses is presented.

Notes:
Only data collected from monitoring wells within the Site boundary are presented.
ug/L = Micrograms per liter.
U = Not detected at the presented laboratory reporting limit (LRL).
J = Estimated value.
Bold font indicates that the constituent was detected above its LRL.
1. The maximum detected concentration and the minimum LRL
(for non-detects) among the primary and duplicate sample is presented.
2. The maximum detected concentration (for detects) and the minimum LRL
(for non-detects) between results from EPH and VPH analyses is presented.
3. Located outside of Disposal Site boundary.

NOTICE OF ACTIVITY AND USE LIMITATION
M.G.L. c. 21E, § 6 and 310 CMR 40.0000

Disposal Site Name: Former JF Corcoran Shoe Company
DEP Release Tracking No.(s): RTN 4-00875

This Notice of Activity and Use Limitation ("Notice") is made as of this 8th day of October, 2009, by Stoughton Center Business Park, LLC of 2 Canton Street, Stoughton, Massachusetts, 02072, together with its successors and assigns (collectively "Owner").

WITNESSETH:

WHEREAS, Stoughton Center Business Park, LLC is the owner in fee simple of that certain parcel of land located in Stoughton, Norfolk County, Massachusetts with the buildings and improvements thereon, pursuant to a deed recorded with the Norfolk Registry of Deeds in Book 19492, Page 29;

WHEREAS, said parcel(s) of land, which is more particularly bounded and described in Exhibit A, attached hereto and made a part hereof ("Property") is subject to this Notice of Activity and Use Limitation. The Property is shown on a plan recorded in the Norfolk Registry of Deeds in Plan Book 404, Plan 154;

WHEREAS, a portion of the Property ("Portion of the Property") is subject to this Notice of Activity and Use Limitation. The Portion of the Property is more particularly bounded and described in Exhibit A-1, attached hereto and made a part hereof. The Portion of the Property is shown on a sketch plan attached hereto and filed herewith for registration;

WHEREAS, the Portion of the Property comprises all of a disposal site as the result of a release of oil and/or hazardous material. Exhibit B is a sketch plan showing the relationship of the Portion of the Property subject to this Notice of Activity and Use Limitation to the boundaries of said disposal site existing within the limits of the Property and to the extent such boundaries have been established. Exhibit B is attached hereto and made a part hereof; and

MARGINAL REFERENCE BOOK 19492 PAGE 29

The language in these forms are part of promulgated regulations and cannot be modified in any way unless so noted (within brackets) in the form itself.

WHEREAS, one or more response actions have been selected for the Disposal Site in accordance with M.G.L. c. 21E ("Chapter 21E") and the Massachusetts Contingency Plan, 310 CMR 40.0000 ("MCP"). Said response actions are based upon (a) the restriction of human access to and contact with oil and/or hazardous material in soil and/or groundwater and/or (b) the restriction of certain activities occurring in, on, through, over or under the Portion of the Property. The basis for such restrictions is set forth in an Activity and Use Limitation Opinion ("AUL Opinion"), dated 10/7/09, (which is attached hereto as Exhibit C and made a part hereof);

NOW, THEREFORE, notice is hereby given that the activity and use limitations set forth in said AUL Opinion are as follows:

1. Activities and Uses Consistent with the AUL Opinion. The AUL Opinion provides that a condition of No Significant Risk to health, safety, public welfare or the environment exists for any foreseeable period of time (pursuant to 310 CMR 40.0000) so long as any of the following activities and uses occur on the Portion of the Property:

(i) Activities and uses on the Portion of the Property involving industrial, retail or commercial development and operations including, but not limited to, day care facilities, educational facilities (provided that they do not offer overnight housing), offices, retail businesses, warehouses/storage areas, restaurants, vehicular and pedestrian traffic, parking and parking garages, landscaping, hardscaping, and routine maintenance of hardscaped or landscaped areas;

(ii) Emergency utility work including excavation, maintenance and repairs to site utilities;

(iii) Short-term (i.e., less than six months) construction, development, excavation and/or other subsurface activities, including, without limitation, non-emergency utility work and re-grading activities;

(iv) Such other activities or uses which, in the Opinion of a Licensed Site Professional (LSP), shall present no greater risk of harm to health, safety, public welfare or the environment than the activities and uses set forth in this Paragraph; and

(v) Such other activities and uses not identified in Paragraph 2 as being Activities and Uses Inconsistent with the AUL.

2. Activities and Uses Inconsistent with the AUL Opinion. Activities and uses which are inconsistent with the objectives of this Notice of Activity and Use Limitation, and which, if implemented at the Portion of the Property may result in a significant risk of harm to health, safety, public welfare or the environment or in a substantial hazard, are as follows:

(i) Use of the Portion of the Property as a single- or multi-family residence, including but not limited to townhouses, condominiums and/or apartments; and,

(ii) Use of the Portion of the Property for "institutional" use as defined in the MCP 310 CMR 40.0006, such as any publicly or privately owned hospital, health care facility, orphanage, nursing home, convalescent home, educational facility, or correctional facility, where such facility in whole or in part provides overnight housing.

(iii) Any long-term (more than 6 months) activity involving disturbance of soil at the Portion of the Property unless such activity is evaluated by a LSP who renders an Opinion that states that such disturbance is consistent with maintaining a condition of No Significant Risk.

3. Obligations and Conditions Set Forth in the AUL Opinion. If applicable, obligations and/or conditions to be undertaken and/or maintained at the Portion of the Property to maintain a condition of No Significant Risk as set forth in the AUL Opinion shall include the following:

(i) A Soil Management Plan must be developed and implemented prior to the initiation of any planned long-term (more than 6 months) invasive activity to be performed with respect to soil at the Portion of the Property. The Soil Management Plan must be prepared by a LSP in accordance with the soil management procedures of the MCP at 310 CMR 40.0030 et seq.; and

(ii) A Health and Safety Plan must be developed and implemented prior to the initiation of any planned long-term (more than 6 months) invasive activity with respect to soil at the Portion of the Property. The Health and Safety Plan must be prepared by a Certified Industrial Hygienist or other qualified individual sufficiently trained in health and safety protocols. The Plan should clearly describe the nature of the oil and/or hazardous materials located in soils throughout the Portion of the Property where invasive activities are planned and specifically identify the types of personal protective equipment, monitoring devices, and engineering controls necessary to ensure that workers are not exposed (in a manner inconsistent with the MCP or this AUL) via dermal contact, ingestion, and/or the inhalation of particulate dusts/vapors. Workers who may come in contact with soil at the Portion of the Property must be informed that soil impacted by oil and/or hazardous materials is located throughout the Portion of the Property and be made aware that all activities in such areas must be performed in compliance with the requirements of the Health and Safety Plan. The Plan must be available on-site throughout the course of the work.

4. Proposed Changes in Activities and Uses. Any proposed changes in activities and uses at the Portion of the Property which may result in higher levels of exposure to oil and/or hazardous material than currently exist shall be evaluated by an LSP who shall render an Opinion, in accordance with 310 CMR 40.1080 *et seq.*, as to whether the proposed changes will present a significant risk of harm to health, safety, public welfare or the environment. Any and all requirements set forth in the Opinion to meet the objective of this Notice shall be satisfied before any such activity or use is commenced.

5. Violation of a Response Action Outcome. The activities, uses and/or exposures upon which this Notice is based shall not change at any time to cause a significant risk of harm to health, safety, public welfare, or the environment or to create substantial hazards due to exposure to oil and/or hazardous material without the prior evaluation by an LSP in accordance with 310 CMR 40.1080 *et seq.*, and without additional response actions, if necessary, to achieve or maintain a condition of No Significant Risk or to eliminate substantial hazards. If at such time in the future any activities, uses and/or exposures upon which this Notice are proposed to change, further assessment of Site conditions and evaluation by an LSP are required to determine if a condition of No Significant Risk exists for all potentially exposed receptors under such proposed use.

If the activities, uses, and/or exposures upon which this Notice is based change without the prior evaluation and additional response actions determined to be necessary by an LSP in accordance with 310 CMR 40.1080 *et seq.*, the owner or operator of the Portion of the Property subject to this Notice at the time that the activities, uses and/or exposures change, shall comply with the requirements set forth in 310 CMR 40.0020.

6. Incorporation Into Deeds, Mortgages, Leases, and Instruments of Transfer. This Notice shall be incorporated either in full or by reference into all future deeds, easements, mortgages, leases, licenses, occupancy agreements or any other instrument of transfer, whereby an interest in and/or a right to use the Property or a portion thereof is conveyed.

Owner hereby authorizes and consents to the filing and recordation and/or registration of this Notice, said Notice to become effective when executed under seal by the undersigned LSP, and recorded and/or registered with the appropriate Registry(ies) of Deeds and/or Land Registration Office(s).

WITNESS the execution hereof under seal this 24th day of September, 2009.

EXHIBIT C
AUL OPINION

EXHIBIT C
ACTIVITY AND USE LIMITATION OPINION

Site Name: Former JF Corcoran Shoe Company
2 Canton Street, Stoughton, Massachusetts
MassDEP Release Tracking Number: 4-00875

In accordance with the requirements of 310 CMR 40.1074, this Activity and Use Limitation (AUL) Opinion has been prepared to support a Notice of Activity and Use Limitation for the Disposal Site to which the Massachusetts Department of Environmental Protection (MassDEP) has assigned Release Tracking Number (RTN) 4-00875 (the "Site"). The Site is located along the northern portion of the property located at 2 Canton Street in Stoughton, Massachusetts.

SITE HISTORY

The Site is located at 2 Canton Street in an area of mixed commercial and residential use in Stoughton, Massachusetts (the "Property"). The eastern portion of the Property consists of an asphalt-paved parking lot that is used for customer and commuter parking for the adjacent Massachusetts Bay Transit Authority (MBTA) commuter rail line. The western portion of the Property is currently improved with four interconnected, masonry and wood-framed mill buildings. These buildings, which have a combined footprint of approximately 73,046 square feet, are currently used for office, retail, studio, and storage space.

The Site includes a portion of the "C-Building", encompasses the entire courtyard area, includes the "A-Building" and "F-Building," and extends to the edge of the Property along Canton Street. The A-Building is currently occupied by a variety of tenants including a framed art store, a martial arts studio, several artist studios, a house of worship, and a plumbing company; the F-Building is currently occupied by a day care facility and additional studio space; and the C-Building is occupied by a fitness center and an elevator. None of the buildings contains a recessed basement, although small crawl spaces are located below the day care facility situated in the F-Building and the customer lobby situated within the A-Building. The AUL applies to the northern portion of the Property, which contains the buildings and courtyard area. A brief description of the primary sources of oil and/or hazardous materials (OHM) at the Site is provided below.

Two underground storage tanks (USTs) formerly located within the courtyard area of the Property served as the source of the Site release(s). One 6,000-gallon fuel oil UST was removed from the Site in November 1989 and one 3,000-gallon fuel oil UST was removed in August 2008. Both tanks were observed to be leaking upon their removal and soil and groundwater impacts within the courtyard area have since been documented. Several investigatory and remedial activities have been conducted at the Site to date, including the removal of the leaking fuel oil USTs, excavation of approximately 400 cubic yards of petroleum-impacted soils, collection of soil, groundwater, soil gas, and

indoor air data, as well as groundwater and NAPL removal, gauging, and monitoring. Despite the extensive soil removal that was conducted in August 2008, residual levels of petroleum hydrocarbons persist in soil, groundwater, and indoor air at the Site, including residual NAPL with a measurable thickness of approximately 0.01 feet within monitoring well WC-3, located along the northwestern corner the courtyard.

REASON FOR ACTIVITY AND USE LIMITATION

In September 2009, a Method 3 Risk Characterization (Method 3 RC) was conducted to evaluate existing soil, groundwater, and indoor air data collected from the Disposal Site to determine whether a condition of No Significant Risk (NSR) to human health, safety, public welfare and the environment exists in support of permanent Site closure. The results of the Method 3 RC indicate that a condition of NSR existed for future trespassers, current and future day care participants, current and future facility workers, current utility workers, and future construction workers potentially exposed to constituents present within Site soil, groundwater, and/or indoor air (day care participants and facility workers only). However, a condition of NSR could not be achieved for future hypothetical residents due to the presence of volatile constituents within indoor air. Therefore, an AUL is required to mitigate future human health risks associated with chronic exposures to volatile constituents that could migrate from the subsurface into the indoor air of an overlying structure (i.e., residence).

In order to ensure that a condition of NSR is maintained at the Site, an AUL is necessary to "lock in" the assumptions and restrictions of the Method 3 RC regarding future Site activities and uses. This AUL is applicable to only a Portion of the Property, which comprises the entire Disposal Site, as described in Exhibit A-1 and depicted in Exhibit B.

The permitted and restricted activities and obligations/conditions of the AUL (if applicable) are summarized in the following paragraphs.

1. Activities and Uses Consistent with the AUL Opinion.

The AUL Opinion provides that a condition of No Significant Risk to health, safety, public welfare or the environment exists for any foreseeable period of time (pursuant to 310 CMR 40.0000) so long as any of the following activities and uses occur on the Portion of the Property:

(i) Activities and uses on the Portion of the Property involving industrial, retail or commercial development and operations including, but not limited to, day care facilities, educational facilities (provided that they do not offer overnight housing), offices, retail businesses, warehouses/storage areas, restaurants, vehicular and pedestrian traffic, parking and parking garages, landscaping, hardscaping, and routine maintenance of hardscaped or landscaped areas;

(ii) Emergency utility work including excavation, maintenance and repairs to site utilities;

(iii) Short-term (i.e., less than six months) construction, development, excavation and/or other subsurface activities, including, without limitation, non-emergency utility work and re-grading activities;

(iv) Such other activities or uses which, in the Opinion of an LSP, shall present no greater risk of harm to health, safety, public welfare or the environment than the activities and uses set forth in this Paragraph; and

(v) Such other activities and uses not identified in Paragraph 2 as being Activities and Uses Inconsistent with the AUL.

2. Activities and Uses Inconsistent with the AUL Opinion.
Activities and uses which are inconsistent with the objectives of this Notice of Activity and Use Limitation, and which, if implemented at the Portion of the Property may result in a significant risk of harm to health, safety, public welfare or the environment or in a substantial hazard, are as follows:

(i) Use of the Portion of the Property as a single- or multi-family residence, including but not limited to townhouses, condominiums and/or apartments; and,

(ii) Use of the Portion of the Property for "institutional" use as defined in the MCP 310 CMR 40.0006, such as any publicly or privately owned hospital, health care facility, orphanage, nursing home, convalescent home, educational facility, or correctional facility, where such facility in whole or in part provides overnight housing.

(iii) Any long-term (more than 6 months) activity involving disturbance of soil at the Portion of the Property unless such activity is evaluated by a LSP who renders an Opinion that states that such disturbance is consistent with maintaining a condition of No Significant Risk.

3. Obligations and Conditions Set Forth in the AUL Opinion.
If applicable, obligations and/or conditions to be undertaken and/or maintained at the Property to maintain a condition of No Significant Risk as set forth in the AUL Opinion shall include the following:

(i) A Soil Management Plan must be developed and implemented prior to the initiation of any planned long-term (more than 6 months) invasive activity to be performed with respect to soil at the Portion of the Property. The Soil Management Plan must be prepared by a LSP in accordance with the soil management procedures of the MCP at 310 CMR 40.0030 et seq.; and

(ii) A Health and Safety Plan must be developed and implemented prior to the initiation of any planned long-term (more than 6 months) invasive activity with respect to soil at the Portion of the Property. The Health and Safety Plan must be

prepared by a Certified Industrial Hygienist or other qualified individual sufficiently trained in health and safety protocols. The Plan should clearly describe the nature of the oil and/or hazardous materials located in soils throughout the Portion of the Property where invasive activities are planned and specifically identify the types of personal protective equipment, monitoring devices, and engineering controls necessary to ensure that workers are not exposed (in a manner inconsistent with the MCP or this AUL) via dermal contact, ingestion, and/or the inhalation of particulate dusts/vapors. Workers who may come in contact with soil at the Portion of the Property must be informed that soil impacted by oil and/or hazardous materials is located throughout the Portion of the Property and be made aware that all activities in such areas must be performed in compliance with the requirements of the Health and Safety Plan. The Plan must be available on-site throughout the course of the work.

RE: Response Action Outcome Amendment
25 Brock Street,
Stoughton, MA
RTN # 4-13476
Norfolk Job No. 238.002

Dear Mr. Martin:

Please find attached the amended RAO submittal forms relative to the 25 Brock Street property, RTN # 4-13476.

Norfolk has reviewed the groundwater classification at above address and is amending our previous RAO to a GW1 setting. Recently upon review of Stoughton Town Hall record we identified two (2) potable wells on Morton Street within 500 feet of the 25 Brock Street property. This alteration does not affect the conclusion of the RAO.

If you have any questions or comments concerning this amendment please call the undersigned at 508-822-5500.

Sincerely,

NORFOLK ENVIRONMENTAL, INC.

1.0 INTRODUCTION

This Response Action Outcome (RAO) statement has been prepared upon the request of Mr. Earl Cain, current owner of the 25 Brock Street property, Stoughton, Massachusetts. Norfolk Environmental was retained by Mr. Earl Cain to submit a Response Action Outcome (RAO) to close out a State Spill Incident which occurred on November 5, 1997 (RTN 4-13476). The Immediate Response Action (IRA) was performed by others during November 1997, and included the excavation of up to 40 cubic yards of soil. The information provided hereafter is based on conversations with Mr. Earl Cain (owner), Mr. Edmund Solari (tenant and proprietor of MDM Machine Shop, 25 Brock Street) and a review of available DEP files.

- **Person Conducting Immediate Response Action:** Mr. Earl Cain
- **Relationship to Site:** Owner
- **Contact:** Mr. Earl Cain
- **Address:** P.O. Box 3565, Homossassa Springs, Florida 34447
- **Telephone:** (508) 824-9173

2.0 SITE LOCATION AND DESCRIPTION

The Site is located at 25 Brock Street near the center of the Town of Stoughton. The Site consists of two parcels totaling 5.35 acres of land on Lots 104 and 105, Stoughton Assessor's Maps 48 and 49. The MBTA railroad property abuts the eastern border of the Site. The Site is located at an approximate elevation of 65 meters above sea level according to the USGS 15 Minute Topographic Map for the Brockton quadrangle. The land slopes down westwards to a wetland area and small brook on the western portion of the property and northwards towards to a wetland area located on the abutting property to the north. Please refer to Figure 1 - Site Locus.

The Site is improved by three buildings. Building #1, located on Lot 104, is a large two story wood frame structure constructed of red brick. This building currently operates as ECCM, Inc. (a phone repair shop, woodworking shop, warehouse/storage area, and office area), and a security and advertising business. Building #2, located on Lot 105, is a single store wood frame structure supported by pier and beams. This building currently operates as Suburban Insulation and the MDM machine shop. Building #3, located on Lot 105, is constructed of fieldstone and wood, and currently operated as a machine shop.

Surrounding Receptors

The Site is located in an area of residential, commercial and industrial use. Residential properties abut the western and southern property lines. Commercial, industrial and residential properties abut the northern and eastern property lines. The MBTA railroad tracks directly abut the Site to the east. The nearest schools, the Jones School and the Kimball School are located one-half mile northeast of the Site.

3.0 MASSACHUSETTS CONTINGENCY PLAN SETTING

Groundwater Classification

Based on the review of Stoughton Town Hall records and the New England Data Map, Mass GIS maps prepared for the 25 Brock Street property, the Site is within an area of GW-1 classified groundwater. The Site is within 500 feet of two (2) potable private water supply wells located on Morton Street in Stoughton, Massachusetts. The Site not located within an Interim Wellhead Protection Area, within a Zone A of a Class A surface water body, or within an approved Zone II area of contribution of a municipal water supply well. The Site groundwater is also classified GW-2/GW-3.

Soil Classification

The Reportable Concentration category for a release to soil where the soil is at or within 500 feet of a residential dwelling, a residentially owned property, school, playground, recreational area or park is RCS-1. The RCS-1 concentration for total petroleum hydrocarbons (TPH) is 200 mg/Kg. The reportable quantity for diesel fuel oil is 10 gallons. The soil at the location of the spill has an exposure potential of S-2 on the basis that the soil is accessible but a child's frequency and intensity of use are both considered to be low according to 310 CMR 40.0933(4)(a) and (b).

A cleanup goal of 200 mg/kg based on the strictest (S-1/GW-1) MCP soil exposure standards were selected, in order to avoid the necessity of filing an Activity and Use Limitation for this property.

4.0 DESCRIPTION OF THE RELEASE

On November 5, 1997 between 3:30 and 4.00 p.m., approximately 15 gallons or less of #2 heating oil was reported to have leaked from a 0.25 inch (inside diameter) pipe associated with a 275 (or 235)-gallon aboveground storage tank (AST). The 275-gallon AST was located centrally on the south side of Building #2, the MDM Machine Shop. According to Mr. Edmund Solari, the release occurred when the AST accidentally tipped over against the side of Building #2, after it was filled. On behalf of Mr. Solari the Stoughton Fire Department made the initial oral notification to the Department of Environmental Protection (DEP) on November 8, 1997 at 12:20 p.m. The DEP issued a release tracking number (RTN) 4-13476 for the Site. Oil contaminated soil was observed in the vicinity of the release area.

5.0 STATUS OF REMEDIAL ACTIONS

Doyle Enterprises (Doyle) was contracted by Mr. Earl Cain to coordinate the assessment and remediation of the #2 fuel oil release. Mr. John Higgins of Envirosense, New Hampshire, was initially hired as Licensed Site Professional. A verbal IRA was approved by the DEP for the excavation of up to 25 cubic yards of soil as part as subsurface investigation to determine the point source and the extent of contamination.

Between November 14 and 26, 1998, Doyle Enterprises coordinated the excavation of petroleum contaminated soil in the location of the release. Doyle excavated in total approximately 40 cubic yards of soil in association with the AST release. Contaminated soil was stockpiled on 6 mil polyethylene liner on site, 75 to 80 feet east of the release area at the west wall of Building #1. Please refer to Figure One - Site Locus for the

location of the former soil stockpile. The excavation was reportedly backfilled with clean granular fill. Shortly thereafter, Doyle activities at the Site ceased. The soil stockpile remained on-site since November 1997 and no further action regarding the closure of the Number 2 fuel oil release had been performed prior to May 1999.

6.0 RESPONSE ACTIONS PERFORMED BY NORFOLK

On May 3, 1999 Norfolk advanced four (4) soil borings in the vicinity of the former 275-gallon AST spill area to a maximum depth of six (6) feet below grade. Groundwater was encountered between three (3) and five (5) feet below grade. The locations of each soil boring are located on Figure 2 - Site Plan.

Soils encountered in the vicinity of the spill area included granular fill (gray, medium to coarse grained sand and gravel), which varied in depth from 6 inches to four feet below grade. Below the fill material native soils were encountered. Native soils included: dark brown sandy loam and gravel; gray, fine to medium sand and gravel; gray/rust colored fine to medium grained sand; rust colored medium to coarse grained sand and silt; and rust colored fine grained silty sand. Fine gravel to large cobbles were encountered at varies depths below grade.

Olfactory or visual evidence of oil contaminated soil was not observed. Soil samples at one foot intervals were retained for field screening with an HNu brand Photo Ionizing Detector (PID), equipped with a 10.2 ev lamp, using the standard DEP jar-headspace procedure. PID readings indicated non-detectable levels for Total Volatile Organic compounds. Refer to Table 1 for a summary of PID analysis.

Table 1 - Photo Ionizing Detection

Soil Boring ID	Depth of boring (feet)	Soil Boring Location	PID reading (ppm)
B-1	6'	1' through 6'	ND
B-2	6'	2' through 6'	ND
B-3	5'	2' through 5'	ND
B-4	3'	one sample @ 3'	0.4

Note: ND = not detected

6.1 Confirmatory Analysis

Soil samples taken form the groundwater interface were sent to ESS Laboratories, of Warwick, Rhode Island, Massachusetts, for confirmatory TPH analysis via EPA Method 8100.

Table 4 - ESS Analytical Results /Total Petroleum Hydrocarbons (TPH)

Sample ID	TPH mg/Kg
B1 @ 4'	ND
B2 @5'	ND
B3 @ 5'	ND
B4 @ 3'	ND
DEP Mtd. 1/GW-1/S-1 Cleanup Standard	**200**

Notes: ND = Not Detectable above Laboratory Reporting Limit

Concentrations of TPH were non-detectable in soil samples taken from the groundwater interface in soil samples B1 through B4. Norfolk has concluded that petroleum contaminated soil was adequately excavated by Doyle to background levels. No further excavation is required at the Site. Refer to Appendix B for Laboratory Results.

7.0 MANAGEMENT OF REMEDIATION WASTE

A total of 37.01 tons of Number 2 fuel oil contaminated soil excavated and stockpile on Site by Doyle between November 14 and 26, 1997, were transported by B and C Construction of Stoughton, MA under an LSP certified Bill of Lading on May 14, 1999 to the Bardon Trimount facility in Stoughton, Massachusetts for Hot/cold asphalt recycling. Refer to Bill of Lading, attached as Appendix A.

8.0 ACHIEVEMENT OF NO SIGNIFICANT RISK

In accordance with the Method I Risk Characterization set forth in 310 CMR 40.0973 (7), it is the conclusion of Norfolk Environmental that, as a result of the above described TPH analyses, a level of "no significant risk" has been achieved for soils and groundwater at the Site and that a Class A-1 Response Action Outcome (RAO) has been achieved. As described above, Norfolk has determined that levels of petroleum contaminants in the soils in the vicinity of the #2 fuel oil spill origin were removed to non-detectable levels.

9.0 FEASIBILITY EVALUATION

A Feasibility Evaluation is not required under the MCP with an A-1 RAO Statement, at which soil concentrations are non-detectable below cleanup standards and can be reasonably assumed to at background levels.

10.0 ADDITIONAL ACTIVITIES

No further remedial or investigation activities are scheduled or deemed necessary for this Site. The Site does not require an Activity and Use Limitation in the deed based upon a Class A-1 RAO.

11.0 NOTIFICATION TO PUBLIC OFFICIALS

In accordance with public involvement requirements of the MCP, the Chief Municipal Officer and Board of Health in Stoughton, Massachusetts have been notified in writing about remedial activities performed at the Site.

12.0 LICENSED SITE PROFESSIONAL OPINION

I, Brian V. Moran, P.E., a Licensed Site Professional in the Commonwealth of Massachusetts, License # 7351, attest by my signature and stamp appearing below that the Response Action Outcome described herein, has been conducted in conformance with the Massachusetts Department of Environmental Protection.

Please call the undersigned at (508)-822-5500 if you have any questions or comments on the above submittal.

Regards,
Norfolk Environmental

RE: **Immediate Response Action Completion Report /Response Action Outcome**
Commercial Property
Off 17 Morton Square
Stoughton, Massachusetts
RTN 4-13478

Dear Mr. Tonaszuck:

Coneco Engineers and Scientists (CONECO) has been contracted to perform a Immediate Response Action (IRA) and Response Action Outcome (RAO) at the commercial property located at Off 17 Morton Square in Stoughton, Massachusetts, hereinafter, the "Site." The enclosed report was prepared in accordance with the Massachusetts Contingency Plan (310 CMR 40.0000) and is based on the Immediate Response Action (IRA) Plan recently completed at the Site. In summary, it is the opinion of CONECO that the IRA analytical results indicate that a condition of "No Significant Risk" exists for soil and groundwater at the Site. An Immediate Response Action Completion Form (BWSC-105) and Response Action Outcome Form (BWSC-104) are presented as Appendix A (Tab 1).

CONECO's oversight and assessment findings are detailed in the attached report. If there are any questions, please contact the undersigned.

Sincerely,
Coneco Engineers and Scientists

Thomas B. Heyner, Jr.

1.0 INTRODUCTION

1.1 Background

Available information related to the release at the Site is as follows:

On November 10, 1997, Mr. David Tonaszuck of the Department of Environmental Protection (DEP) - Southeastern Regional Office (SERO) issued a Notice of Responsibility (NOR) to the owner of the Site for stained areas of soil and improperly stored waste oil. According to the owner of the Site, the stained areas of soil are the result of former equipment storage which has been removed from the Site. As such, the quantity of the motor oil release is unknown and observed to be limited to a 8-foot by 9-foot area of the Site.

1.2 Scope of Services

In accordance with our contract, CONECO has performed an Immediate Response Action and Response Action Outcome (RAO) at the commercial property located at Off 17 Morton Square in Stoughton, Massachusetts. Consistent with applicable guidelines for an "Immediate Response Action" and "Response Action Outcome" as presented in the MCP (310 CMR 40.0000), the objective of this IRA was to remove petroleum-contamination soils impacted by the release of motor oil to background concentrations, remove the improperly-stored waste oil at the Site, and determine whether groundwater had been impacted by the release. To accomplish this objective, CONECO performed the following tasks:

1. A Site-specific Health and Safety Plan was updated and implemented for CONECO on-Site investigatory personnel.

2. On December 5, 1997, five shallow, hand-dug test holes were performed at the Site to delineate the release as well as obtain soil samples to submit for disposal criteria laboratory analysis. Soil samples from the test holes were composited into a single soil sample for disposal criteria analysis at a Massachusetts-certified laboratory.

3. On December 31, 1997, Mr. David Tonaszuck of DEP-SERO granted verbal permission to conduct an IRA which included the removal of up to 10 cubic yards of petroleum contaminated soil and the proper disposal of the waste oil at a licensed disposal facility.

4. Contaminated soils were excavated on January 5, 1998 and transported under a Bill of Lading to the Bardon Trimount Facility located in Stoughton, Massachusetts for destruction for asphalt batching.

5. Representative soil samples were collected from the bottom and sidewalls of the excavation area. Soil samples were screened in the field for volatile compounds (VCs) utilizing a HNu Model HW-101 10.2 eV photoionization detector (PID) and total petroleum hydrocarbons (TPH) by a Petroflag® Hydrocarbon Analyzer. Select soil samples from the

bottom and sidewalls of the excavation were submitted to a Massachusetts-certified laboratory for analysis of total petroleum hydrocarbons (TPH) as diesel range organics (DRO) by EPA Method 8100.

6. The improperly stored waste oil at the Site was transported to a licensed facility on March 18, 1998.

7. As determined by the above investigations, the conditions of the Site were evaluated within the scope and meaning of the Massachusetts Oil and Hazardous Materials Release Prevention and Response Act, Chapter 21E of the Massachusetts General Laws, and the MCP (310 CMR 40.0000).

2.0 SITE OVERVIEW

2.1 Site Parameters

The Site is located on Morton Street approximately 600 feet south of the intersection of Perry Street in Stoughton, Massachusetts. A Site Locus Map and Site Plan are provided for reference as Figures 1 and 2, respectively. Site photographs are presented as Appendix B (Tab 2).

Coordinates:	UTM 4,665,050 meters N UTM 326,175 meters E (Zone 19)
Ownership:	The current Site owner is Murphy Coal Co., Inc.
